Phone Alert Status Profile (PASP)

Bluetooth® Test Specification

- **Issued** 2016-07-14
- **Document Number** PASP.TS.1.0.3
- **Group Prepared by** BTI
- **Feedback Email** bti-main@bluetooth.org
- **Abstract**
  
  This document defines test structures and procedures for conformance test of products implementing the Phone Alert Status Profile Specification.

DISCLAIMER AND COPYRIGHT NOTICE

This disclaimer applies to all draft specifications and final specifications adopted by the Bluetooth SIG Board of Directors (both of which are hereinafter referred to herein as a Bluetooth “Specification”). Your use of this Specification in any way is subject to your compliance with all conditions of such use, and your acceptance of all disclaimers and limitations as to such use, contained in this Specification. Any user of this Specification is advised to seek appropriate legal, engineering or other professional advice regarding the use, interpretation or effect of this Specification on any matters discussed in this Specification.

Use of Bluetooth Specifications and any related intellectual property is governed by the Promoters Membership Agreement among the Promoter Members and Bluetooth SIG (the “Promoters Agreement”), certain membership agreements between Bluetooth SIG and its Adopter and Associate Members, including, but not limited to, the Membership Application, the Bluetooth Patent/Copyright License Agreement and the Bluetooth Trademark License Agreement (collectively, the “Membership Agreements”) and the Bluetooth Specification Early Adopters Agreements (1.2 Early Adopters Agreements) among Early Adopter members of the unincorporated Bluetooth SIG and the Promoter Members (the “Early Adopters Agreement”). Certain rights and obligations of the Promoter Members under the Early Adopters Agreements have been assigned to Bluetooth SIG by the Promoter Members.

Use of the Specification by anyone who is not a member of Bluetooth SIG or a party to an Early Adopters Agreement (each such person or party, a “Member”) is prohibited. The use of any portion of a Bluetooth Specification may involve the use of intellectual property rights (“IPR”), including pending or issued patents, or copyrights or other rights. Bluetooth SIG has made no search or investigation for such rights and disclaims any undertaking or duty to do so. The legal rights and obligations of each Member are governed by the applicable Membership Agreements, Early Adopters Agreement or Promoters Agreement. No license, express or implied, by estoppel or otherwise, to any intellectual property rights are granted herein.

Any use of the Specification not in compliance with the terms of the applicable Membership Agreements, Early Adopters Agreement or Promoters Agreement is prohibited and any such prohibited use may result in (i) termination of the applicable Membership Agreements or Early Adopters Agreement and (ii) liability claims by Bluetooth SIG or any of its Members for patent, copyright and/or trademark infringement claims permitted by the applicable agreement or by applicable law.

THE SPECIFICATION IS PROVIDED “AS IS” WITH NO WARRANTIES WHATSOEVER, INCLUDING ANY WARRANTY OF MERCHANTABILITY, NONINFRINGEMENT, FITNESS FOR ANY PARTICULAR PURPOSE, SATISFACTORY QUALITY, OR REASONABLE SKILL OR CARE, OR ANY WARRANTY ARISING OUT OF ANY COURSE OF DEALING, USAGE, TRADE PRACTICE, PROPOSAL, SPECIFICATION OR SAMPLE.

Each Member hereby acknowledges that products equipped with the Bluetooth wireless technology (“Bluetooth Products”) may be subject to various regulatory controls under the laws and regulations applicable to products using wireless non licensed spectrum of various governments worldwide. Such laws and regulatory controls may govern, among other things, the combination, operation, use, implementation and distribution of Bluetooth Products. Examples of such laws and regulatory controls include, but are not limited to, airline regulatory controls, telecommunications regulations, technology transfer controls and health and safety regulations. Each Member is solely responsible for the compliance by their Bluetooth Products with any such laws and regulations and for obtaining any and all required authorizations, permits, or licenses for their Bluetooth Products related to such regulations within the applicable jurisdictions. Each Member acknowledges that nothing in the Specification provides any information or assistance in connection with securing such compliance, authorizations or licenses. NOTHING IN THE SPECIFICATION CREATES ANY WARRANTIES, EITHER EXPRESS OR IMPLIED, REGARDING SUCH LAWS OR REGULATIONS.

ALL LIABILITY, INCLUDING LIABILITY FOR INFRINGEMENT OF ANY INTELLECTUAL PROPERTY RIGHTS OR FOR NONCOMPLIANCE WITH LAWS, RELATING TO USE OF THE SPECIFICATION IS EXPRESSLY DISCLAIMED. To the extent not prohibited by law, in no event will Bluetooth SIG or its Members or their affiliates be liable for any damages, including without limitation, lost revenue, profits, data or programs, or business interruption, or for special, indirect, consequential, incidental or punitive damages, however caused and regardless of the theory of liability, arising out of or related to any furnishing, practicing, modifying, use or the performance or implementation of the contents of this Specification, even if Bluetooth SIG or its Members or their affiliates have been advised of the possibility of such damages. BY USE OF THE SPECIFICATION, EACH MEMBER EXPRESSLY WAIVES ANY CLAIM AGAINST BLUETOOTH SIG AND ITS MEMBERS OR THEIR AFFILIATES RELATED TO USE OF THE SPECIFICATION.

If this Specification is an intermediate draft, it is for comment only. No products should be designed based on it except solely to verify the prototyping specification at SIG sponsored IOP events and it does not represent any commitment to release or implement any portion of the intermediate draft, which may be withdrawn, modified, or replaced at any time in the adopted Specification.

Bluetooth SIG reserves the right to adopt any changes or alterations to the Specification it deems necessary or appropriate.

Copyright © 2012–2016. The Bluetooth word mark and logos are owned by Bluetooth SIG, Inc. All copyrights in the Bluetooth Specifications themselves are owned by Ericsson AB, Lenovo (Singapore) Pte. Ltd., Intel Corporation, Microsoft Corporation, Apple Inc., Nokia Corporation and Toshiba Corporation. Other third-party brands and names are the property of their respective owners.

1 Scope

This Bluetooth document contains the Test Suite Structure (TSS) and Test Cases (TC) to test the Bluetooth Phone Alert Status Profile Specification.

The objective of this test specification is to provide a basis for interoperability tests for Bluetooth devices giving a high probability of air interface interoperability between different manufacturers’ Bluetooth devices.
2 References, Definitions, and Abbreviations

2.1 References

This Bluetooth document incorporates, by dated or undated reference, provisions from other publications. These normative references are cited at the appropriate places in the text and the publications are listed hereafter.

For the purpose of this Bluetooth document, the definitions in [1] and [2] apply.

2.3 Abbreviations

For the purpose of this Bluetooth document, the abbreviations in [1] and [2] apply.
3 Test Suite Structure (TSS)

3.1 Overview

The Phone Alert Status Profile is a client of the Generic Attribute Profile (GATT). This is illustrated in Figure 3.1.

![Diagram showing the relationship between Phone Alert Status Profile and GATT](image)

**Figure 3.1: Phone Alert Status Profile Test Model**

3.2 Test Strategy

The test objectives are to verify functionality of the Phone Alert Status Profile and enable interoperability between different devices. The testing approach is to cover mandatory and optional requirements in the Profile specification and to match these to the support of the IUT as described in the ICS Proforma.

The basis for the test approach is the general concepts and conformance testing principles defined in ISO/IEC 9646-1 and ISO/IEC 9646-2; both are part of the OSI Conformance Testing Methodology and Framework (CTMF).

The conformance test equipment shall provide an implementation of the Radio Controller and the parts of the Host Subsystem needed to perform the test cases defined in the Phone Alert Status Profile Test Specification. For some test cases, it is necessary to stimulate the IUT from an Upper Tester. In practice, this could be implemented as a special test interface, an MMI, or another interface supported by the IUT.

The following configuration is recommended for testing Phone Alert Status client IUT:
The Phone Alert Status Profile test suite contains Valid Behavior (BV) tests complemented with Invalid Behavior (BI) tests where required. The test coverage mirrored in the test suite structure is the result of a process that started with catalogued specification requirements that were logically grouped and assessed for testability enabling coverage in defined test cases.

The test suite structure is a tree with the first level representing the protocol groups as listed in section 3.3.

### 3.3 Test Groups

The following test groups have been defined.

#### 3.3.1 Discovery of Services and Characteristics and Descriptors

This group tests IUT discover of the Phone Alert Status Service and Characteristics and Descriptors and. Where applicable these tests are included by reference from [8].

#### 3.3.2 Configuration Features

This group tests IUT implementation of the Phone Alert Status Profile Read and Write Features.

#### 3.3.3 Read Features

This group tests IUT implementation of the Phone Alert Status Profile Read Features.

#### 3.3.4 Write Features

This group tests IUT implementation of the Phone Alert Status Profile Write Features.

#### 3.3.5 Notify Features

This group tests IUT implementation of the Phone Alert Status Profile Notify Features.
# 4 Test Cases

## 4.1 Introduction

### 4.1.1 Test Case Identification Conventions

Test cases shall be assigned unique identifiers per the conventions in [1]. The convention used here is `<spec abbreviation>/<IUT role>/<class>/<xx>-<nn>-<y>`.

Test group abbreviations for class, feature, function, sub-function or capability (as applicable to this test specification) are defined in Table 4.1.

### 4.1.2 Conformance

When conformance is claimed, all capabilities indicated as mandatory for this Specification shall be supported in the specified manner (process-mandatory). This also applies for all optional and conditional capabilities for which support is indicated. All mandatory capabilities, and optional and conditional capabilities for which support is indicated are subject to verification as part of the Bluetooth certification program.

The Bluetooth Qualification Program may employ tests to verify implementation robustness. The level of implementation robustness that is verified varies from one Specification to another and may be revised for cause based on interoperability issues found in the market.

Such tests may verify

- that claimed capabilities may be used in any order and any number of repetitions that are not excluded by the Specification, OR

- that capabilities enabled by the implementations are sustained over durations expected by the use case, OR
that the implementation gracefully handles any quantity of data expected by the use case, OR

that the implementation gracefully rejects any attempt to exercise capabilities which were declared as not supported. Graceful rejection means that the implementation demonstrates uninterrupted conformance to the specification immediately after rejecting such attempts without any need to be externally reset or adjusted, OR

that in cases where more than one valid interpretation of the Specification exists, the implementation complies with at least one interpretation and gracefully handles other interpretations OR

that the implementation is immune to attempted security exploits.

A single execution of each of the required tests is required in order to constitute a pass verdict. However, it is noted that in order to provide a foundation for interoperability, it is necessary that a qualified implementation consistently and repeatedly pass any of the applicable tests.

In any case, where a member finds an issue with the Test Plan Generator, the test case as described in the test specification, or with the test system utilized, the member is required to notify the responsible party via an errata request such that the issue may be addressed.

### 4.1.3 Pass/Fail Verdict Conventions
Each test case has an Expected Outcome section, which outlines all the detailed pass criteria conditions that shall be met by the IUT to merit a Pass Verdict.

The convention in this test specification is that, unless there are a specific set of fail conditions outlined in the test case, the IUT fails the test case as soon as one of the pass criteria conditions cannot be met. If this occurs, the outcome of the test shall be the Fail Verdict.

### 4.2 Setup Preambles

#### 4.2.1 Set up LE Transport
Use GATT.TS [6] Preamble [Set up ATT Bearer over LE].

### 4.3 Discover Services and Characteristics and Descriptors
The test group objective is to verify Phone Alert Status Profile Discovery of Services and Characteristics.

The procedures defined in this test group verify IUT discovery of the Services defined in the Phone Alert Status Service Specification [7] by a Phone Alert Status Server IUT, by a Phone Alert Status Client IUT.

#### 4.3.1 PASP/CL/PPD/BV-01-I [Discover Phone Alert Status Service]
- Test Purpose
Verify that the Phone Alert Status Service can be detected by the Phone Alert Status Client IUT.

- Reference
  [4] 4.1

- Initial Condition

Establish an ATT Bearer connection between the Lower Tester and IUT; see 4.2. The Lower Tester includes at least one instantiation of the Phone Alert Status Service [7].

- Test Procedure

The Upper Tester issues a command to the IUT to discover primary services. There are two alternatives:

1. Execute the procedure included in GATT.TS [6] Discover All Primary Services, GATT/CL/GAD/BV-01-C, once, with the database specified in [7].

2. Execute the procedure included in GATT.TS [6] Discover Primary Services by Service UUID, GATT/CL/GAD/BV-02-C, with the service UUID set to «Phone Alert Status Service», with the database specified in [7].
• Expected Outcome

Pass verdict
At least one attribute handle range is returned, containing the starting handle and the ending handle of each instantiation of a Phone Alert Status Service definition.

4.3.2 PASP/CL/PPD/BV-02-I [Discover Alert Status Characteristic]

• Test Purpose
Verify that the Alert Status Characteristic can be detected by the Phone Alert Status Client IUT.

• Reference
[4] 4.2

• Initial Condition
Establish an ATT Bearer connection between the Lower Tester and IUT; see 4.2.
The Lower Tester includes at least one instantiation of the Phone Alert Status Service [7].
The IUT has executed PASP/CL/PPD/BV-01-I [Discover Phone Alert Status Service], and has saved the handle range for an instantiation of the Phone Alert Status Service. That instantiation contains an instantiation of the Alert Status characteristic.

• Test Procedure
The Upper Tester issues a command to the IUT to discover characteristics. There are two alternatives:

   ATT Bearer established over selected transport
   PASP/CL/PPD/BV-01-I has been executed.

   ATT_Read_By_Type_Request
   (Code = 0x08, 1st Handle, end Handle,
   Type=, <Characteristic>)

   ATT_Read_By_Type_Resp.
   (Code = 0x09, Length,
   Sets of handle-value pairs)

   DiscServiceChar
   (service handle range)

   DiscAllServices
   (handle/characteristic list)

2. Execute the procedure included in GATT.TS [6] Discover Characteristics by UUID, GATT/CL/GAD/BV-05-C once, with the characteristic UUID set to «Alert Status», with the database specified in initial conditions.

   • Expected Outcome

   Pass verdict
   One attribute handle is returned for an Alert Status Characteristic implemented in the Lower Tester.

4.3.3 PASP/CL/PPD/BV-03-I [Discover Alert Status – Client Characteristic Configuration Descriptor]

   • Test Purpose

   Verify that the Phone Alert Status Client IUT can discover the Client Characteristic Configuration descriptor of the Alert Status characteristic.

   • Reference

   [4] 4.2

   • Initial Condition

   Establish an ATT Bearer connection between the Lower Tester and IUT; see 4.2.
   The Lower Tester includes at least one instantiation of the Phone Alert Status Service [7].
The IUT has executed PASP/CL/PPD/BV-01-I [Discover Phone Alert Status Service], and has saved the handle range for an instantiation of the Phone Alert Status Service.

- **Test Procedure**

The Upper Tester issues a command to the IUT to Discover All Characteristic Descriptors using the handle range returned after running PASP/CL/PPD/BV-01-I [Discover Phone Alert Status Service] above.

- **Expected Outcome**

**Pass verdict**

At least one attribute handle/UUID pair is returned with UUID = «Client Characteristic Descriptor».

4.3.4 **PASP/CL/PPD/BV-04-I [Discover Ringer Setting Characteristic]**

- **Test Purpose**

Verify that the Ringer Setting Characteristic can be detected by the Phone Alert Status Client IUT.

- **Reference**

[4] 4.2

- **Initial Condition**

Establish an ATT Bearer connection between the Lower Tester and IUT; see 4.2.
The Lower Tester includes at least one instantiation of the Phone Alert Status Service [7]. The IUT has executed PASP/CL/PPD/BV-01-I [Discover Phone Alert Status Service], and has saved the handle range for an instantiation of the Phone Alert Status Service. That instantiation contains an instantiation of the Ringer Setting characteristic.

- **Test Procedure**

The Upper Tester issues a command to the IUT to discover characteristics. There are two alternatives:

- **Expected Outcome**

  **Pass verdict**

  One attribute handle is returned for a Ringer Setting Characteristic implemented in the Lower Tester.

### 4.3.5 PASP/CL/PPD/BV-05-I [Discover Ringer Setting – Client Characteristic Configuration Descriptor]

- **Test Purpose**

  Verify that the Phone Alert Status Client IUT can discover the Client Characteristic Configuration descriptor of the Ringer Setting characteristic.

- **Reference**

  [4] 4.2

- **Initial Condition**

  Establish an ATT Bearer connection between the Lower Tester and IUT; see 4.2.

  The Lower Tester includes at least one instantiation of the Phone Alert Status Service [7].

  The IUT has executed PASP/CL/PPD/BV-01-I [Discover Phone Alert Status Service], and has saved the handle range for an instantiation of the Phone Alert Status Service.

- **Test Procedure**

  The Upper Tester issues a command to the IUT to Discover All Characteristic Descriptors using the handle range returned after running PASP/CL/PPD/BV-01-I [Discover Phone Alert Status Service] above.

### Expected Outcome

**Pass verdict**

At least one attribute handle/UUID pair is returned with UUID = «Client Characteristic Descriptor».

### 4.3.6 PASP/CL/PPD/BV-06-I [Discover Ringer Control Point Characteristic]

#### Test Purpose

Verify that the Ringer Control Point Characteristic can be detected by the Phone Alert Status Client IUT.

#### Reference

[4] 4.2

#### Initial Condition

Establish an ATT Bearer connection between the Lower Tester and IUT; see 4.2.

The Lower Tester includes at least one instantiation of the Phone Alert Status Service [7].

The IUT has executed PASP/CL/PPD/BV-01-I [Discover Phone Alert Status Service], and has saved the handle range for an instantiation of the Phone Alert Status Service. That instantiation contains an instantiation of the Ringer Control Point characteristic.

#### Test Procedure
The Upper Tester issues a command to the IUT to discover characteristics. There are two alternatives:

2. Execute the procedure included in GATT.TS [6] Discover Characteristics by UUID, GATT/CL/GAD/BV-05-C once, with the characteristic UUID set to «Ringer Control Point», with the database specified in initial conditions.

• Expected Outcome

Pass verdict
One attribute handle is returned for a Ringer Control Point Characteristic implemented in the Lower Tester.

4.4 Configuration Feature

The procedures defined in this test group verify Phone Alert Status Server IUT implementation of the Features defined in the Phone Alert Status Profile Specification [4] by a Phone Alert Status Server IUT, and usage of the same features by a Phone Alert Status Client IUT.

4.4.1 PASP/CL/PPCF/BV-01-I [Alert Status Characteristic Configuration, write with 0x0001]

• Test Purpose

Verify that the Phone Alert Status Client IUT can configure the Client Characteristic Configuration of Alert Status in a Phone Alert Status Server.

• Reference

• Initial Condition

A preamble procedure defined in Section 4.2 is used to setup the transport and L2CAP channel.

The Lower Tester includes one instantiation of the Phone Alert Status Service [7]. The IUT has executed PASP/CL/PPD/BV-03-I [Discover Alert Status – Client Characteristic Configuration Descriptor], and has saved the handle of a Client Characteristic Configuration for Alert Status Characteristic.

• Test Procedure

The Upper Tester issues a command to the IUT to configure to receive Ringer Setting.
4.4.2 PASP/CL/PPCF/BV-03-I [Ringer Setting Characteristic Configuration, write with 0x0001]

• Test Purpose

Verify that the Phone Alert Status Client IUT can configure the Client Characteristic Configuration of Ringer Setting in a Phone Alert Status Server.

• Reference

[4] 4.8

• Initial Condition

A preamble procedure defined in Section 4.2 is used to setup the transport and L2CAP channel.

The Lower Tester includes one instantiation of the Phone Alert Status Service [7]. The IUT has executed PASP/CL/PPD/BV-03-I [Discover Ringer Setting – Client Characteristic Configuration Descriptor], and has saved the handle of a Client Characteristic Configuration for Ringer Setting Characteristic.

• Test Procedure

Pass verdict

The IUT sends a correctly formatted ATT_Write_Request to the Lower Tester, containing the handle specified by the Upper Tester, and the value set to <0x0001, Notification>.

The IUT receives a correctly formatted ATT_Write_Response from the Lower Tester and sends the WriteResponse to the Upper Tester.
The Upper Tester issues a command to the IUT to configure to receive Alert Status.

L2CAP Connection established over selected transport. PASP/CL/PPD/BV-05-I has been executed.

**ATT_Write_Request**
(Code = 0x12, Handle of Client Characteristic Configuration, Notification)

**ATT_Write_Response**
(Code = 0x13, handle)

**WriteRequest**
(handle, value)

**WriteResponse**
(handle)

- **Expected Outcome**

  **Pass verdict**
  The IUT sends a correctly formatted ATT_Write_Request to the Lower Tester, containing the handle specified by the Upper Tester, and the value set to <0x0001, Notification>.
  The IUT receives a correctly formatted ATT_Write_Response from the Lower Tester and sends the WriteResponse to the Upper Tester.

**4.5 Read Features**

The procedures defined in this test group verify Phone Alert Status Server IUT implementation of the Features defined in the Phone Alert Status Profile Specification [4] by a Phone Alert Status Server IUT, and usage of the same features by a Phone Alert Status Client IUT.

**4.5.1 PASP/CL/PPRF/BV-01-I [Alert Status Characteristic read]**

- **Test Purpose**
  Verify that the Phone Alert Status Client IUT can read the Alert Status value in a Phone Alert Status Server.

- **Reference**
  [4] 4.3

- **Initial Condition**
  A preamble procedure defined in Section 4.2 is used to setup the transport and L2CAP channel.
The Lower Tester includes one instantiation of the Phone Alert Status Service [7].

The IUT has executed PASP/CL/PPD/BV-02-I [Discover Alert Status Characteristic], and has saved the handle range for an instantiation of the Phone Alert Status Service. That instantiation contains an instantiation of the Alert Status characteristic.

- Test Procedure

The Upper Tester issues a command to the IUT to read Alert Status characteristics. Execute GATT.TS [6] Read Characteristic Value, GATT/CL/GAR/BV-01-C.

- Expected Outcome

Pass verdict

The IUT sends a correctly formatted ATT_Read_Request to the Lower Tester, containing the handle specified by the Upper Tester.

The IUT receives a correctly formatted ATT_Read_Response from the Lower Tester and sends the ReadRes containing the correct Alert Status value to the Upper Tester.

The received Alert Status value matches the one sent by the Lower Tester.

4.5.2 PASP/CL/PPRF/BV-02-I [Ringer Setting Characteristic, read]

- Test Purpose

Verify that the Phone Alert Status Client IUT can read the Ringer Setting value in a Phone Alert Status Server.

- Reference

• Initial Condition

A preamble procedure defined in Section 4.2 is used to setup the transport and L2CAP channel.

The Lower Tester includes one instantiation of the Phone Alert Status Service [7].

The IUT has executed PASP/CL/PPD/BV-04-I [Discover Ringer Setting Characteristic], and has saved the handle range for an instantiation of the Phone Alert Status Service. That instantiation contains an instantiation of the Ringer Setting characteristic.

• Test Procedure

The Upper Tester issues a command to the IUT to read Ringer Setting.

Execute GATT.TS [6] Read Characteristic Value, GATT/CL/GAR/BV-01-C,

• Expected Outcome

Pass verdict

The IUT sends a correctly formatted ATT_Read_Request to the Lower Tester, containing the handle specified by the Upper Tester.

The IUT receives a correctly formatted ATT_Read_Response from the Lower Tester and sends the ReadRes containing the correct the Ringer Setting value to the Upper Tester.

The received Ringer Setting value matches the one sent by the Lower Tester.

4.6 Write Features

• Test Purpose

The procedures defined in this test group verify Phone Alert Status Server IUT implementation of the Features defined in the Phone Alert Status Profile Specification [4] by a Phone Alert Status Server IUT, and usage of the same features by a Phone Alert Status Client IUT.

Verify that the Phone Alert Status Client IUT can write the Ringer Control Point characteristic in a Phone Alert Status Server.

• Reference

[4] 4.9, 4.10

• Initial Condition

A preamble procedure defined in Section 4.2 is used to setup the transport and L2CAP channel.

The IUT has executed PASP/CL/PPD/BV-06-I [Discover Ringer Control Point Characteristic], and has saved the handle of a Ringer Control Point characteristic.
IUT has executed PASP/CL/PPCF/BV-01-I [Alert Status Characteristic Configuration, write with 0x0001] or PASP/CL/PPCF/BV-03-I [Ringer Setting Characteristic Configuration, write with 0x0001] if needed.

• Test Procedure

The following test procedure applies to the test cases listed in the table below:

1. If the test case is for set to “silent mode”, set to silent mode by writing value 0x01 to the Ringer Control Point by executing the test procedure of GATT test case GATT/SR/GAW/BV-01-C.

2. If the test case is for set to “release silent mode”, set to release silent mode by writing value 0x03 to the Ringer Control Point.

3. If the test case is for execute “mute a ringer once”, execute mute a ringer once by writing value 0x02 to the Ringer Control Point.

• Expected Outcome

The following pass and Fail verdicts apply to the test cases listed in the table below:

Pass verdict

The characteristic value is successfully written according to Table 4.2 value requirements.
Write Feature Test Cases

<table>
<thead>
<tr>
<th>Test Case</th>
<th>Value Requirements</th>

</tr>
</tbody>
</table>

Table 4.2: Write Feature Test Cases

4.7 Notify Feature

The procedures defined in this test group verify Phone Alert Status Server IUT implementation of the Features defined in the Phone Alert Status Profile Specification [4] by a Phone Alert Status Server IUT, and usage of the same features by a Phone Alert Status Client IUT.

4.7.1 PASP/CL/PPNF/BV-01-I [Alert Status Characteristic, Notify]

• Test Purpose
  
  Verify that the Phone Alert Status Client IUT can receive notification of the Alert Status characteristic in a Phone Alert Status Server.

• Reference
  
  [4] 4.4

• Initial Condition
  
  A preamble procedure defined in Section 4.2 is used to setup the transport and L2CAP channel.

  The Lower Tester includes one instantiation of the Phone Alert Status Service [7].

  The IUT has executed PASP/CL/PPD/BV-02-I [Discover Alert Status Characteristic], and has saved the handle of an Alert Status Characteristic.

  The IUT has executed PASP/CL/PPCF/BV-01-I [Alert Status Characteristic Configuration, write with 0x0001] to expect Alert Status Notification.

• Test Procedure
  
  The Lower Tester sends an ATT_Handle_Value_Notification containing an Alert Status characteristic value to the IUT.
• Expected Outcome

Pass verdict
The IUT indicated the received Alert Status value to the Upper Tester, e.g. Notification (Alert Status value: 0x01, Ringer state active). The reported Alert Status value matches the one sent by the Lower Tester.

4.7.2 PASP/CL/PPNF/BV-02-I [Ringer Setting Characteristic, Notify]

• Test Purpose
Verify that the Phone Alert Status Client IUT can receive notification of the Ringer Setting characteristic in a Phone Alert Status Server.

• Reference

• Initial Condition
A preamble procedure defined in Section 4.2 is used to setup the transport and L2CAP channel.

The Lower Tester includes one instantiation of the Phone Alert Status Service [7].

The IUT has executed PASP/CL/PPD/BV-03-I [Discover Alert Status – Client Characteristic Configuration Descriptor], and has saved the handle of a Ringer Setting characteristic.

The IUT has executed PASP/CL/PPCF/BV-03-I [Ringer Setting Characteristic Configuration, write with 0x0001] to expect Ringer Setting Notification.

• Test Procedure
The Lower Tester sends an ATT_Handle_Value_Notification containing a Ringer Setting characteristic value to the IUT.

![Diagram showing L2CAP Connection established over selected transport. PASP/CL/PPD/BV-03-I has been executed. PASP/CL/PPCF/BV-03-I has been executed.]

- Expected Outcome
  
  **Pass verdict**
  
  The IUT indicated the received Ringer Setting value to the Upper Tester, e.g. Notification (Ringer Setting value: 0x00, mute). The reported Ringer Setting value matches the one sent by the Lower Tester.

### 4.8 Phone Alert Status Client Behavior

The procedures defined in this test group verify Phone Alert Status Server IUT implementation of the Features defined in the Phone Alert Status Profile Specification [4] by a Phone Alert Status Server IUT, and usage of the same features by a Phone Alert Status Client IUT.

#### 4.8.1 PASP/CL/PPCB/BV-01-I [Read the Alert Status after Connection Setup]

- **Test Purpose**

  Verify that the Phone Alert Status Client IUT start to read the Alert Status characteristic in a Phone Alert Status Server.

- **Reference**

  [4] 4.11

- **Initial Condition**

  The Lower Tester and IUT are disconnected.

- **Test Procedure**

  The Lower Tester connects to the IUT and starts connection setup (including service discovery and service search).
• Expected Outcome

Pass verdict
The IUT indicated reads the Alert Status characteristic in the Phone Alert Status server spontaneously.

4.9 Connection Features
The procedures defined in this test group verify Phone Alert Status Server IUT implementation of the Features defined in the Phone Alert Status Profile Specification [4] by a Phone Alert Status Server IUT, and usage of the same features by a Phone Alert Status Client IUT.

4.9.1 Verify Bond Status on Reconnection
• Test Purpose
Verify that the Central starts encryption with a previously bonded Peripheral on reconnection, and success.

• Test Case IDs

PASP/CL/TPCN/BV-01-I
PASP/SR/TPCN/BV-01-I

• Reference

[4] 5.2.3

• Initial Condition
The IUT and the Lower Tester are bonded.
No connection is established between the IUT and Lower Tester.

• Test Procedure
1. The Lower Tester begins advertising using GAP undirected connectable mode.
2. The IUT establishes a connection to the Lower Tester.
3. The IUT starts encryption when the connection is established.

• Expected Outcome

Pass verdict
The IUT starts encryption when the connection is established.
Encryption is successfully done.
5 Test Case Mapping

The Test Case Mapping Table (TCMT) maps test cases to specific capabilities in the ICS. Profiles, protocols and services may define multiple roles, and it is possible that a product may implement more than one role. The product shall be tested in all roles for which support is declared in the ICS document.

The columns for the TCMT are defined as follows:

Item: contains an y/x reference, where y corresponds to the table number and x corresponds to the feature number as defined in the ICS Proforma for Phone Alert Status Profile (PASP) [3]. If the item is defined with Protocol, Profile or Service abbreviation before y/x, the table and feature number referenced are defined in the abbreviated ICS proforma document.

Feature: recommended to be the primary feature defined in the ICS being tested or may be the test case name.

Test Case(s): the applicable test case identifiers required for Bluetooth Qualification if the corresponding y/x references defined in the Item column are supported.

Test Case Applicable: may be used to note if a test is required based on the supported features.

For purpose and structure of the ICS/IXIT proforma and instructions for completing the ICS/IXIT proforma refer to the Bluetooth ICS and IXIT proforma document.
