Automation IO Service (AIOS)

Bluetooth® Test Specification

- Issued 2016-07-13
- Document Number [AIOS.TS.1.0.1]
- Group Prepared by [Automation Working Group]
- Feedback Email [automation-main@bluetooth.org]
- Abstract

This document defines test structures and procedures for conformance test of products implementing the Automation IO Service Specification.

DISCLAIMER AND COPYRIGHT NOTICE

This disclaimer applies to all draft specifications and final specifications adopted by the Bluetooth SIG Board of Directors (both of which are hereinafter referred to herein as a Bluetooth “Specification”). Your use of this Specification in any way is subject to your compliance with all conditions of such use, and your acceptance of all disclaimers and limitations as to such use, contained in this Specification. Any user of this Specification is advised to seek appropriate legal, engineering or other professional advice regarding the use, interpretation or effect of this Specification on any matters discussed in this Specification.

Use of Bluetooth Specifications and any related intellectual property is governed by the Promoters Membership Agreement among the Promoter Members and Bluetooth SIG (the “Promoters Agreement”), certain membership agreements between Bluetooth SIG and its Adopter and Associate Members, including, but not limited to, the Membership Application, the Bluetooth Patent/Copyright License Agreement and the Bluetooth Trademark License Agreement (collectively, the “Membership Agreements”) and the Bluetooth Specification Early Adopters Agreements (1.2 Early Adopters Agreements) among Early Adopter members of the unincorporated Bluetooth SIG and the Promoter Members (the “Early Adopters Agreement”). Certain rights and obligations of the Promoter Members under the Early Adopters Agreements have been assigned to Bluetooth SIG by the Promoter Members.

Use of the Specification by anyone who is not a member of Bluetooth SIG or a party to an Early Adopters Agreement (each such person or party, a “Member”) is prohibited. The use of any portion of a Bluetooth Specification may involve the use of intellectual property rights (“IPR”), including pending or issued patents, or copyrights or other rights. Bluetooth SIG has made no search or investigation for such rights and disclaims any undertaking or duty to do so. The legal rights and obligations of each Member are governed by the applicable Membership Agreements, Early Adopters Agreement or Promoters Agreement. No license, express or implied, by estoppel or otherwise, to any intellectual property rights are granted herein.

Any use of the Specification not in compliance with the terms of the applicable Membership Agreements, Early Adopters Agreement or Promoters Agreement is prohibited and any such prohibited use may result in (i) termination of the applicable Membership Agreements or Early Adopters Agreement and (ii) liability claims by Bluetooth SIG or any of its Members for patent, copyright and/or trademark infringement claims permitted by the applicable agreement or by applicable law.

THE SPECIFICATION IS PROVIDED “AS IS” WITH NO WARRANTIES WHATSOEVER, INCLUDING ANY WARRANTY OF MERCHANTABILITY, NONINFRINGEMENT, FITNESS FOR ANY PARTICULAR PURPOSE, SATISFACTORY QUALITY, OR REASONABLE SKILL OR CARE, OR ANY WARRANTY ARISING OUT OF ANY COURSE OF DEALING, USAGE, TRADE PRACTICE, PROPOSAL, SPECIFICATION OR SAMPLE.

Each Member hereby acknowledges that products equipped with the Bluetooth wireless technology (“Bluetooth Products”) may be subject to various regulatory controls under the laws and regulations applicable to products using wireless non licensed spectrum of various governments worldwide. Such laws and regulatory controls may govern, among other things, the combination, operation, use, implementation and distribution of Bluetooth Products. Examples of such laws and regulatory controls include, but are not limited to, airline regulatory controls, telecommunications regulations, technology transfer controls and health and safety regulations. Each Member is solely responsible for the compliance by their Bluetooth Products with any such laws and regulations and for obtaining any and all required authorizations, permits, or licenses for their Bluetooth Products related to such regulations within the applicable jurisdictions. Each Member acknowledges that nothing in the Specification provides any information or assistance in connection with securing such compliance, authorizations or licenses. NOTHING IN THE SPECIFICATION CREATES ANY WARRANTIES, EITHER EXPRESS OR IMPLIED, REGARDING SUCH LAWS OR REGULATIONS.

ALL LIABILITY, INCLUDING LIABILITY FOR INFRINGEMENT OF ANY INTELLECTUAL PROPERTY RIGHTS OR FOR NONCOMPLIANCE WITH LAWS, RELATING TO USE OF THE SPECIFICATION IS EXPRESSLY DISCLAIMED. To the extent not prohibited by law, in no event will Bluetooth SIG or its Members or their affiliates be liable for any damages, including without limitation, lost revenue, profits, data or programs, or business interruption, or for special, indirect, consequential, incidental or punitive damages, however caused and regardless of the theory of liability, arising out of or related to any furnishing, practicing, modifying, use or the performance or implementation of the contents of this Specification, even if Bluetooth SIG or its Members or their affiliates have been advised of the possibility of such damages. BY USE OF THE SPECIFICATION, EACH MEMBER EXPRESSLY WAIVES ANY CLAIM AGAINST BLUETOOTH SIG AND ITS MEMBERS OR THEIR AFFILIATES RELATED TO USE OF THE SPECIFICATION.

If this Specification is an intermediate draft, it is for comment only. No products should be designed based on it except solely to verify the prototyping specification at SIG sponsored IOP events and it does not represent any commitment to release or implement any portion of the intermediate draft, which may be withdrawn, modified, or replaced at any time in the adopted Specification.

Bluetooth SIG reserves the right to adopt any changes or alterations to the Specification it deems necessary or appropriate.

5 Test Case Mapping ........................................................................................................................................................43
1 Scope

This Bluetooth document contains the Test Suite Structure (TSS) and Test Cases (TC) to test the Automation IO Service Specification.

The objective of this test specification is to provide a basis for interoperability tests for Bluetooth devices giving a high probability of air interface interoperability between different manufacturers’ Bluetooth devices.
2 Normative References, Definitions, and Abbreviations

2.1 References

This Bluetooth document incorporates, by dated or undated reference, provisions from other publications. These normative references are cited at the appropriate places in the text and the publications are listed hereafter. Additional definitions and abbreviations can be found in [1] and [2].

[1] Test Strategy and Terminology Overview
[2] Bluetooth Core Specification, Version 4.0 or later
[7] Automation IO Service Implementation extra Information for Test, IXIT
[8] Characteristic and Descriptor descriptions are accessible via the Bluetooth SIG Assigned Numbers
3 Test Suite Structure (TSS)

3.1 Overview

The Automation IO Service requires the presence of GAP, SM (for LE), SDP (for BR/EDR) and GATT. This is illustrated in Figure 3.1.

![Automation IO Service Test Model](image)

Figure 3.1: Automation IO Service Test Model

3.2 Test Strategy

The test objectives are to verify functionality of the Automation IO Service within a Bluetooth Host and enable interoperability between Bluetooth Hosts on different devices. The testing approach is to cover mandatory and optional requirements in the service specification and to match these to the support of the IUT as described in the ICS Proforma [4].

The test equipment shall provide an implementation of the Radio Controller and the parts of the Host needed to perform the test cases defined in the Automation IO Service Test Specification. For some test cases, it is necessary to stimulate the IUT from an Upper Tester. In practice, this could be implemented as a special test interface, an MMI, or another interface supported by the IUT.

The Automation IO test suite contains Valid Behavior (BV) tests complemented with Invalid Behavior (BI) tests where required. The test coverage mirrored in the test suite structure is the result of a process that started with catalogued specification requirements that were logically grouped and assessed for testability enabling coverage in defined Test Cases.
The interface between the IUT and the Upper Tester may be

- a man-machine interface
- provided by the IUT manufacturer

### 3.3 Test Groups

The following test groups have been defined:

#### 3.3.1 Service Definition

Verify the service definition.

#### 3.3.2 Characteristic Declaration

Verify the presence and contents of characteristic declarations.

#### 3.3.3 Characteristic Combinations

Verify that combinations of characteristics and combinations of property fields of the characteristic declarations.

#### 3.3.4 Characteristic Descriptors

Verify the presence and contents of characteristic descriptors.

#### 3.3.5 Characteristic Read

Verify characteristics which support reading can be read. Verify the format and value of characteristic values.

#### 3.3.6 Characteristic Write and Write without Response

Verify characteristics which support writing can be written with or without response.

#### 3.3.7 Configure Indication and Notification

Verify characteristics can be configured for indication or notification.

- Digital / Aggregate Notification
  
  - Verify compliant digital / aggregate operation in response to enable and disable characteristic notification.

#### 3.3.8 Analog / Aggregate Notification

Verify compliant analog / aggregate operation in response to enable and disable characteristic notification.

- Digital / Aggregate Indication
  
  - Verify compliant digital / aggregate operation in response to enable and disable characteristic indication.
• Analog / Aggregate Indication
  - Verify compliant analog / aggregate operation in response to enable and disable characteristic indication.
4 Test Cases

4.1 Introduction

4.1.1 Test Case Identification Conventions

Test cases shall be assigned unique identifiers per the conventions in [2]. The convention used here is AIOS/SR/<feat>/<xx>-<nn>-<y>.

Test group abbreviations for "feature" are defined in Table 4.1.

<table>
<thead>
<tr>

4.1.2 Conformance

When conformance is claimed, all capabilities indicated as mandatory for this Specification shall be supported in the specified manner (process-mandatory). This also applies for all optional and conditional capabilities for which support is indicated. All mandatory capabilities, and optional and conditional capabilities for which support is indicated are subject to verification as part of the Bluetooth certification program.

The Bluetooth Qualification Program may employ tests to verify implementation robustness. The level of implementation robustness that is verified varies from one Specification to another and may be revised for cause based on interoperability issues found in the market.

Such tests may verify

- that claimed capabilities may be used in any order and any number of repetitions that is not excluded by the Specification, OR

- that capabilities enabled by the implementations are sustained over durations expected by the use case, OR

- that the implementation gracefully handles any quantity of data expected by the use case, OR
that the implementation gracefully rejects any attempt to exercise capabilities which were declared as not supported. Graceful rejection means that the implementation demonstrates uninterrupted conformance to the specification immediately after rejecting such attempts without any need to be externally reset or adjusted, OR

that in cases where more than one valid interpretation of the Specification exist, the implementation complies with at least one interpretation and gracefully handles other interpretations OR

that the implementation is immune to attempted security exploits

A single execution of each of the required tests is required in order to constitute a pass verdict. However, it is noted that in order to provide a foundation for interoperability, it is necessary that a qualified implementation consistently and repeatedly pass any of the applicable tests.

In any case, where a member finds an issue with the Test Plan Generator, the Test Case as described in the Test Specification, or with the Test System utilized, the Member is required to notify the responsible party via an errata request such that the issue may be addressed.

4.1.3 Pass/Fail Verdict Conventions

Each test case has an Expected Outcome section, which outlines all the detailed pass criteria conditions that shall be met by the IUT to merit a Pass Verdict.

The convention in this test specification is that, unless there is a specific set of fail conditions outlined in the test case, the IUT fails the test case as soon as one of the pass criteria conditions cannot be met. If this occurs, the outcome of the test shall be the Fail Verdict.

4.2 Setup Preambles

The procedures defined in this section are provided for information, as they are used by test equipment in achieving the initial conditions in certain tests.

4.2.1 ATT Bearer on LE Transport

Follow the preamble procedure described in [5] Section 4.2.1.2 with the IUT operating in the Peripheral role.

4.2.2 ATT Bearer on BR/EDR Transport

Follow the preamble procedure described in [5] Section 4.2.1.1.

4.3 Service Definition

Verify the service definition.

4.3.1 AIOS/SR/SD/BV-01-C [Service Definition over LE]

• Test Purpose
Verify that the IUT has an instantiation of the Automation IO Service as a primary service. This test case only applies when using the LE transport.

- Reference

[3] 2

- Initial Condition

Establish an ATT Bearer connection between the Lower Tester and IUT as defined in Section 4.2.1.

- Test Procedure

1. The Lower Tester sends either an `ATT_Read_By_Group_Type_Request` (0x0001, 0xFFFF) with the Attribute Type parameter set to the UUID for «Primary Service» or an `ATT_Find_By_Type_Value_Request` (0x0001, 0xFFFF) to the IUT, with Attribute Type parameter set to the UUID for «Primary Service» and Value set to «Automation IO Service».

2. Verify that one attribute handle range is returned, containing the starting handle and the ending handle of the service definition.

- Expected Outcome

Pass verdict
One attribute handle range is returned containing the starting handle and the ending handle of the Automation IO Service definition. The Attribute Type parameter is set to the UUID for «Primary Service».

### 4.3.2 AIOS/SR/SD/BV-02-C [SDP Record]

- **Test Purpose**

  Verify that the SDP Record for the Automation IO Service is found and contains the correct information. This test case only applies when using the BR/EDR transport.

- **Reference**

  [3] 4

- **Initial Condition**

  An ACL connection over BR/EDR is established between the Lower Tester and IUT as defined in Section 4.2.2

- **Test Procedure**

  1. The Lower Tester establishes an SDP connection to the IUT.
  2. The Lower Tester sends SDP requests to retrieve all attributes of the SDP record for the Automation IO Service.

- **Expected Outcome**

  **Pass verdict**

  The SDP record for the Automation IO Service is found.
  All attributes which are mandatory for the Automation IO Service are present in the SDP record.
  The values of all attributes in the SDP record meet the requirements of the Automation IO Service.
  The GATT Start Handle and GATT End Handle parameters in the SDP record match the start handle and end handle of the Automation IO Service.

### 4.4 Characteristic Declaration

- **Test Purpose**

  This test group contains test cases to verify that the characteristic property field of the characteristic declaration meets the requirements of the service. The verification is performed one characteristic at a time, as enumerated in the test cases in Table 4.2, using this generic test procedure.

- **Reference**
• Initial Condition

The handle range of the Automation IO Service has been previously discovered by the Lower Tester in test case AIOS/SR/SD/BV-01-C [Service Definition over LE] or AIOS/SR/SD/BV-02-C [SDP Record].

Establish an ATT Bearer connection between the Lower Tester and IUT as defined in Section 4.2.1 if using an LE transport or Section 4.2.2 if using a BR/EDR transport.

• Test Procedure

The following test procedure applies to the test cases listed in Table 4.2:

1. Discover all characteristics of the Automation IO Service by executing the test procedure of GATT test case GATT/SR/GAD/BV-04-C and/or GATT/SR/GAD/BV-05-C in [5].

2. For a discovered characteristic that is listed in Table 4.2, verify that the characteristic properties field of the characteristic declaration meets the requirements of the Automation IO Service.

• Expected Outcome

The following verdicts apply to the test cases listed in Table 4.2.

Pass verdict

The characteristic is discovered and the characteristic properties field of the characteristic declaration meets the requirements of the Automation IO Service.

Table 4.2: Characteristic Declaration Test Cases

4.5 Characteristic Combinations

- Test Purpose
  
  This test group contains test cases to verify that combinations of characteristics and combinations of property fields of the characteristic declarations meets the requirements of the service.

- Reference
  
  [3] 3

- Initial Condition
  
  The handle range of the Automation IO Service has been previously discovered by the Lower Tester in test case AIOS/SR/SD/BV-01-C [Service Definition over LE] or AIOS/SR/SD/BV-02-C [SDP Record].

  Establish an ATT Bearer connection between the Lower Tester and IUT as defined in Section 4.2.1 if using an LE transport or Section 4.2.2 if using a BR/EDR transport.

- Test Procedure
  
  The following test procedure applies to the test cases listed in Table 4.3:

  1. Discover all characteristics of the Automation IO Service by executing the test procedure of GATT test case GATT/SR/GAD/BV-04-C and GATT/SR/GAD/BV-05-C in [5].
  2. For the discovered characteristics verify the requirements that is listed in Table 4.3.

- Expected Outcome
  
  The following verdicts apply to the test cases listed in Table 4.3.
Characteristic Combination Test Cases

<table>

</tr>
</tbody>
</table>

Table 4.3: Characteristic Combination Test Cases

4.6 Characteristic Descriptors

- Test Purpose

This test group contains test cases to verify that the characteristic descriptors meet the requirements of the Automation IO Service. The verification is done one descriptor at a time, as enumerated in the test cases in Table 4.4, using this generic test procedure.

- Reference

[3] 3

- Initial Condition

The handle range of each characteristic referenced in the test cases below has been previously discovered by the Lower Tester during the test procedure in Section 4.3.2 or is known to the Lower Tester by other means.

Establish an ATT Bearer connection between the Lower Tester and IUT as defined in Section 4.2.1 if using an LE transport or Section 4.2.2 if using a BR/EDR transport.

- Test Procedure

The following test procedure applies to the test cases listed in Table 4.4:
1. Discover all characteristic descriptors of the characteristic by executing the test procedure of GATT test case GATT/SR/GAD/BV-06-C in [5] using the handle range of the characteristic. The IUT returns at least one handle-UUID pair.

2. If the UUID in a handle-UUID pair is for a characteristic descriptor referenced in a test case below, read the characteristic descriptor by executing the test procedure of GATT test case GATT/SR/GAR/BV-06-C in [5].

3. Verify if mandatory characteristic descriptors are available.

4. Verify the value of the characteristic descriptor meets the requirements of the Automation IO Service.

**Expected Outcome**

The following verdicts apply to the test cases listed in Table 4.4.

**Pass verdict**

The characteristic descriptor is discovered, the characteristic descriptor is read, and the value of the characteristic descriptor meets the requirements of the Automation IO Service.

</tr>
</tbody>
</table>

Table 4.4: Characteristic Descriptor Test Cases

4.7 Characteristic Read

- **Test Purpose**

  This test group contains test cases to read and verify that the characteristic values required by the service are compliant with the specification.

  The verification is performed one characteristic at a time, as enumerated in the test cases in Table 4.5 using this generic test procedure:

- **Reference**

  [3] 3.1.1, 3.2.1 and 3.3.1

- **Initial Condition**

  The handle of each characteristic value referenced in the test cases below has been previously discovered by the Lower Tester during the test procedure in Section 4.4 or is known to the Lower Tester by other means.

  If the IUT requires a bonding procedure then perform a bonding procedure.

  Establish an ATT Bearer connection between the Lower Tester and IUT as defined in Section 4.2.1 if using an LE transport or Section 4.2.2 if using a BR/EDR transport.

  If IUT permissions for the characteristic require a specific security mode or security level, establish a connection meeting those requirements.

- **Test Procedure**

  The following test procedure applies to the test cases listed in Table 4.5:

  1. Read the characteristic value by executing the test procedure of GATT test case GATT/SR/GAR/BV-01-C in [5].

  2. Verify that the characteristic value meets the requirements of the Automation IO Service.

- **Expected Outcome**

  The following verdicts apply to the test cases listed in Table 4.5.

  Pass verdict
The characteristic is successfully read and the characteristic value meets the requirements of the Automation IO Service.

### Characteristic Read Value Test Cases

<table>
<thead>
<tr>
<th>Test Case</th>
<th>Value (Requirements)</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.7.1 AIOS/SR/CR/BV-01-C [Characteristic Read – Digital]</td>

</tr>
<tr>
<td>4.7.2 AIOS/SR/CR/BV-02-C [Characteristic Read – Analog]</td>
<td>For the first readable Analog, verify that the value read corresponds to the value set by the Upper Tester. ([3] 3.2.1).</td>
</tr>
<tr>
<td>4.7.3 AIOS/SR/CR/BV-03-C [Characteristic Read – Aggregate]</td>
<td>Verify that the value read corresponds to the values (aggregated digital inputs and analog inputs) set by the Upper Tester. ([3] 3.3.1).</td>
</tr>
</tbody>
</table>

Table 4.5: Characteristic Read Value Test Cases

### 4.8 Characteristic Write

- **Test Purpose**

  This test group contains test cases to write and verify that the characteristic values required by the service are compliant.

  The verification is performed one characteristic at a time, as enumerated in the test cases in Table 4.6: Characteristic Write Value Test Cases, using this generic test procedure:

- **Reference**

  [3] 3.1.1, 3.2.1

- **Initial Condition**

  The handle of each characteristic value referenced in the test cases below has been previously discovered by the Lower Tester during the test procedure in Section 4.4 or is known to the Lower Tester by other means.

  If the IUT requires a bonding procedure then perform a bonding procedure.

  Establish an ATT Bearer connection between the Lower Tester and IUT as defined in Section 4.2.1 if using an LE transport or Section 4.2.2 if using a BR/EDR transport.

  If IUT permissions for the characteristic require a specific security mode or security level, establish a connection meeting those requirements.

- **Test Procedure**
The following test procedure applies to the test cases listed in Table 4.6:

1. Write the characteristic value by executing the test procedure of GATT test case GATT/SR/GAW/BV-03-C in [5].

2. Verify that the written characteristic value meets the requirements of the Automation IO Service and corresponds to the values seen in the Upper Tester.

• Expected Outcome

The following pass and fail verdicts apply to the test cases listed in Table 4.6:

Pass verdict
The characteristic value is successfully written.

<table>
<thead>
<tr>
<th>Test Case</th>
<th>Value (Requirements)</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.8.1</td>
<td>For the first writable Digital Characteristic, verify that the value is successfully written. ([3] 3.1.1)</td>
</tr>
<tr>
<td>4.8.2</td>
<td>For the first writable Analog Characteristic, verify that the value is successfully written ([3] 3.2.1)</td>
</tr>
</tbody>
</table>

Table 4.6: Characteristic Write Value Test Cases

4.9 Characteristic Write without Response

• Test Purpose

This test group contains test cases to write without response and verify that the characteristic values required by the service are compliant.

The verification is performed one characteristic at a time, as enumerated in the test cases in Table 4.7, using this generic test procedure:

• Reference

[3] 3.1.1, 3.2.1

• Initial Condition

The handle of each characteristic value referenced in the test cases below has been previously discovered by the Lower Tester during the test procedure in Section 4.4 or is known to the Lower Tester by other means.

The optional property “Write without response” is set.

If the IUT requires a bonding procedure then perform a bonding procedure.
Establish an ATT Bearer connection between the Lower Tester and IUT as defined in Section 4.2.1 if using an LE transport or Section 4.2.2 if using a BR/EDR transport.

If IUT permissions for the characteristic require a specific security mode or security level, establish a connection meeting those requirements.

- Test Procedure

The following test procedure applies to the test cases listed in Table 4.7:

1. Write the characteristic value by executing the test procedure of GATT test case GATT/SR/GAW/BV-01-C in [5].

2. Verify that the written characteristic value meets the requirements of the Automation IO Service and corresponds to the values seen in the Upper Tester.

- Expected Outcome

The following pass and fail verdicts apply to the test cases listed in Table 4.7:

**Pass verdict**

The characteristic value is successfully written.

<table>
<thead>
<tr>
<th>Test Case</th>
<th>Value (Requirements)</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.9.1 AIOS/SR/CW/BV-03-C</td>
<td>For the first Digital Characteristic supporting Write without Response, verify that the value is successfully written. ([3] 3.1.1).</td>
</tr>
<tr>
<td>4.9.2 AIOS/SR/CW/BV-04-C</td>
<td>For the first Analog Characteristic supporting Write without Response, verify that the value is successfully written ([3] 3.2.1).</td>
</tr>
</tbody>
</table>

*Table 4.7: Characteristic Write Value without Response Test Cases*

### 4.10 Configure Indication and Notification

- Test Purpose

This test group contains test cases to verify compliant operation in response to enable and disable characteristic indication or notification.

The verification is performed one characteristic at a time, as enumerated in the test cases in Table 4.8, using this generic test procedure:

- Reference

  [3] 3.1.2, 3.2.2, 3.3.2

- Initial Condition
The handle of each characteristic value referenced in the test cases below has been previously discovered by the Lower Tester during the test procedure in Section 4.3.2 or is known to the Lower Tester by other means.

The handle of the client characteristic configuration descriptor of each characteristic referenced in the test cases below has been previously discovered by the Lower Tester during the test procedure in Section 4.6 or is known to the Lower Tester by other means.

If the IUT requires a bonding procedure then perform a bonding procedure.

Establish an ATT Bearer connection between the Lower Tester and IUT as defined in Section 4.2.1 if using an LE transport or Section 4.2.2 if using a BR/EDR transport.

If IUT permissions for the characteristic descriptor require a specific security mode or security level, establish a connection meeting those requirements.

**Test Procedure**

The following test procedure applies to the test cases listed in Table 4.8:

1. Disable indication or notification by writing value 0x0000 to the client characteristic configuration descriptor of the first available digital or analog characteristic using the test procedure of GATT test case GATT/SR/GAW/BV-08-C in [5].

2. If the test case is for notification, enable notification by writing value 0x0001 to the client characteristic configuration descriptor of the characteristic.

3. If the test case is for indication, enable indication by writing value 0x0002 to the client characteristic configuration descriptor of the characteristic.

4. The Lower Tester reads the value of the client characteristic configuration descriptor.

**Expected Outcome**

The following pass and fail verdicts apply to the test cases listed in Table 4.8:

**Pass verdict**

The characteristic descriptor is successfully written and the value returned when read is consistent with the value written.

<td>0x0002 ([3] 3.3.2).</td>
</tr>
</tbody>
</table>

Table 4.8: Configure Indication and Notification Test Cases

4.11 Digital /Aggregate Notification Test Cases

- Test Purpose

  This test group contains test cases to verify compliant operation in response to enable and disable characteristic notification.

  The verification is done if a Digital characteristic with Read Property is available, when enumerated in the test cases in Table 4.9.

  Verify that the IUT can send notifications of a Digital or Aggregate characteristic. If an Aggregate characteristic is available this will be used for notification.

  If multiple digital characteristics are present the verification is performed using first available characteristics present, as enumerated in the test cases in Table 4.9, using this generic test procedure:

- Reference

  [3] 3.1

- Initial Condition

  If the IUT requires a bonding procedure then perform a bonding procedure.

  Establish an ATT Bearer connection between the Lower Tester and IUT as defined in Section 4.2.1 if using an LE transport or Section 4.2.2 if using a BR/EDR transport.

  If IUT permissions for the Digital characteristic require a specific security mode or security level, establish a connection meeting those requirements.

- Test Procedure
1. If a Custom Condition is not used update the Value Trigger Setting and Time Trigger Setting according to the test cases in Table 4.9.

2. Configure the Digital or Aggregate characteristic for notification (both cannot be configured for notification at the same time), see Section 4.10.

3. Perform an action on the IUT that will induce it, once connected, to send notifications of the Digital or Aggregate characteristic (see Table 4.9 for the requirements on how this is done).

4. A connection is established between the Lower Tester and IUT meeting the security requirements of the IUT, if not already done so prior to step 1.

5. If required, the Upper Tester is used to trigger the notification.

6. The Lower Tester receives an ATT_Handle_Value_Notification from the IUT containing the Digital or Aggregate characteristic handle and value.

7. Verify that the characteristic value meets the requirements of the Automation IO Service and the value set/given by the Upper Tester.

8. If required perform an action to stop notifications and then repeat steps 5-7 until the Lower Tester receives additionally at least one more notification.

9. The Lower Tester configures the Digital or Aggregate characteristic to disable notifications.

10. Repeat steps 1-2 with notifications disabled.

11. Verify that the Lower Tester does not receive an ATT_Handle_Value_Notification from the IUT containing the Digital characteristic or the Aggregate characteristic (depending on which is used).

• Expected Outcome:

Pass verdict

If a Value Trigger Setting descriptor and Time Trigger Setting descriptor is used to trigger the notification, two responses are valid for the writing of the ValueTrigger Setting or Time Trigger Setting Condition value:

- The IUT returns the error code “Trigger condition value not supported” (see [3] 1.6). In this case, test execution shall cease with a PASS verdict applied.

- The IUT accepts the value written and the test continues.

- The IUT sends one or more notifications of the Digital or Aggregate characteristic.

- The value of each field of the characteristic meets the requirements of the Automation IO Service and has the same value as given/set by the Upper Tester.
- The IUT stops sending notifications of the Digital or Aggregate characteristic after the Lower Tester configures the characteristic to disable notifications.

*Table 4.9: Digital Notification Test Cases*

**4.12 Analog /Aggregate Notification Test Cases**

- **Test Purpose**

  This test group contains test cases to verify compliant operation in response to enable and disable characteristic notification.

  The verification is done one Analog characteristic with Read Property at a time, as enumerated in the test cases in Table 4.10.

  Verify that the IUT can send notifications of an Analog or Aggregate characteristic. If an Aggregate characteristic is available this will be used for notification.
The verification is performed one characteristic at a time (first available if multiple analog characteristics are present), as enumerated in the test cases in Table 4.10, using this generic test procedure:

• Reference
  
  [3] 3.2

• Initial Condition

If the IUT requires a bonding procedure then perform a bonding procedure.

Establish an ATT Bearer connection between the Lower Tester and IUT as defined in Section 4.2.1 if using an LE transport or Section 4.2.2 if using a BR/EDR transport.

If IUT permissions for the Analog characteristic require a specific security mode or security level, establish a connection meeting those requirements.

• Test Procedure

1. If a Custom Condition is not used update the Value Trigger Setting and Time Trigger Setting according to the test cases in Table 4.10. The Value Trigger Setting should be set according to IXIT [7].

2. Configure the Analog or Aggregate characteristic for notification (both cannot be configured for notification at the same time), see Section 4.10.

3. Perform an action on the IUT that will induce it, once connected, to send notifications of the Analog or Aggregate characteristic (see

| 4.12.1 AIOS/SR/CN/BV-17-C [Analog Notification – Value Trigger Setting Condition value 0x00 and the Time Trigger Setting condition is 0x03] | Write 0x00 to the Value Trigger Setting Condition Field ([3] 3.5.1).  
Write 0x03 to the Time Trigger Condition Field ([3] 3.5.2).  
Verify that notifications are sent when the value condition and the time condition are fulfilled ([3] 3.5.1 and 3.5.2). |
|---|---|
| 4.12.2 AIOS/SR/CN/BV-18-C [Analog Notification – Value Trigger Setting Condition value 0x01 and the Time Trigger Setting condition is 0x03] | Write 0x01 to the Value Trigger Setting Condition Field ([3] 3.5.1).  
Write 0x03 to the Time Trigger Condition Field ([3] 3.5.2).  
Verify that notifications are sent when the value condition and the time condition are fulfilled ([3] 3.5.1 and 3.5.2). |

4. Table 4.10 Table 4.10 for the requirements on how this is done).
5. A connection is established between the Lower Tester and IUT meeting the security requirements of the IUT, if not already done so prior to step 1.

6. If required, the Upper Tester is used to trigger the notification.

7. The Lower Tester receives an `ATT_Handle_Value_Notification` from the IUT containing the Analog characteristic handle and value.

8. Verify that the characteristic value meets the requirements of the Automation IO Service and the value set/given by the Upper Tester.

9. If required perform an action to stop notifications and then repeat steps 5-7 until the Lower Tester receives additionally at least one more notification.

10. The Lower Tester configures the Analog or Aggregate characteristic to disable notifications.

11. Repeat steps 1-2 with notifications disabled.

12. Verify that the Lower Tester does not receive an `ATT_Handle_Value_Notification` from the IUT containing the Analog or Aggregate characteristic.

- **Expected Outcome**

  **Pass verdict**

  If a Trigger Setting descriptor is used to enable the notification, two responses are valid for the writing of the Trigger Setting Condition value:

  - The IUT returns the error code “Trigger condition value not supported” (see [3] 1.6). In this case, test execution shall cease with a PASS verdict applied.

  - The IUT accepts the value written and the test continues.

  - The IUT sends one or more notifications of the Analog or Aggregate characteristic.

  - The value of each field of the characteristic meets the requirements of the Automation IO Service and has the same value as given/set by the Upper Tester.

  - The IUT stops sending notifications of the Analog or Aggregate characteristic after the Lower Tester configures the characteristic to disable notifications.

**Table 4.10: Analog Notification Test Cases**

### 4.13 Digital /Aggregate Indication Test Cases

- **Test Purpose**

  This test group contains test cases to verify compliant operation in response to enable and disable characteristic indication.

  The verification is done if a Digital characteristic with Read Property is available, when enumerated in the test cases in Section 4.4.

  Verify that the IUT can send indications of a Digital or Aggregate characteristic. If an Aggregate characteristic is available this will be used for notification.

  The verification is performed one characteristic at a time (first available if multiple digital characteristics are present), as enumerated in the test cases in Table 4.11, using this generic test procedure:

  - **Reference**

    [3] 3.1

  - **Initial Condition**
If the IUT requires a bonding procedure then perform a bonding procedure.

Establish an ATT Bearer connection between the Lower Tester and IUT as defined in Section 4.2.1 if using an LE transport or Section 4.2.2 if using a BR/EDR transport.

If IUT permissions for the Digital characteristic require a specific security mode or security level, establish a connection meeting those requirements.

- **Test Procedure**

  1. If a Custom Condition is not used update the Value Trigger Setting and Time Trigger Setting according to the test cases in Table 4.11.
  2. Configure the Digital or Aggregate characteristic for indication (both cannot be configured for indication at the same time), see Section 4.10.
  3. Perform an action on the IUT that will induce it, once connected, to send indications of the Digital or Aggregate characteristic (see Table 4.11 for the requirements on how this is done).
  4. A connection is established between the Lower Tester and IUT meeting the security requirements of the IUT, if not already done so prior to step 1.
  5. If required the Upper Tester is used to trigger the indication.
  6. The Lower Tester receives an \textit{ATT\_Handle\_Value\_Indication} from the IUT containing the Digital characteristic handle and value.
  7. Verify that the characteristic value meets the requirements of the Automation IO Service and the value set/given by the Upper Tester.
  8. If required perform an action to stop indications and then repeat steps 5-7 until the Lower Tester receives additionally at least one more indication.
  9. The Lower Tester configures the Digital or Aggregate characteristic to disable indications.
  10. Repeat steps 1-2 with indications disabled.
  11. Verify that the Lower Tester does not receive an \textit{ATT\_Handle\_Value\_Indication} from the IUT containing the Digital characteristic or the Aggregate characteristic (depending on which is used).

- **Expected Outcome:**

  **Pass verdict**

  If a Value Trigger Setting descriptor and Time Trigger Setting descriptor is used to trigger the indication, two responses are valid for the writing of the Value Trigger Setting or Time Trigger Setting Condition value:

  - The IUT returns the error code “Trigger condition value not supported” (see [3] 1.6). In this case, test execution shall cease with a PASS verdict applied.
- The IUT accepts the value written and the test continues.
- The IUT sends one or more indications of the Digital or Aggregate characteristic.
- The value of each field of the characteristic meets the requirements of the Automation IO Service and has the same value as given/set by the Upper Tester.
- The IUT stops sending indications of the Digital or Aggregate characteristic after the Lower Tester configures the characteristic to disable indications.

*Table 4.11: Digital Indication Test Cases*

### 4.14 Analog /Aggregate Indication Test Cases

- **Test Purpose**

  This test group contains test cases to verify compliant operation in response to enable and disable characteristic indication.

  The verification is done one Analog characteristic with Read Property at a time, as enumerated in the test cases in *Table 4.12*.

  Verify that the IUT can send indications of an Analog or Aggregate characteristic. If an Aggregate characteristic is available this will be used for indication.

  The verification is performed one characteristic at a time (first available if multiple analog characteristics are present), as enumerated in the test cases in *Table 4.12*, using this generic test procedure:

  - **Reference**

    [3] 3.1

  - **Initial Condition**
If the IUT requires a bonding procedure then perform a bonding procedure.

Establish an ATT Bearer connection between the Lower Tester and IUT as defined in Section 4.2.1 if using an LE transport or Section 4.2.2 if using a BR/EDR transport.

If IUT permissions for the Analog characteristic require a specific security mode or security level, establish a connection meeting those requirements.

- **Test Procedure**

  1. If a Custom Condition is not used to update the Value Trigger Setting and Time Trigger Setting according to the test cases in Table 4.12, the Value Trigger Setting should be set according to the IXIT [7].

  2. Configure the Analog or Aggregate characteristic for indication (both cannot be configured for indication at the same time), see Section 4.10.

  3. Perform an action on the IUT that will induce it, once connected, to send indications of the Analog or Aggregate characteristic (see Table 4.12 for the requirements on how this is done).

  4. A connection is established between the Lower Tester and IUT meeting the security requirements of the IUT, if not already done so prior to step 1.

  5. If required the Upper Tester is used to trigger the indication.

  6. The Lower Tester receives an ATT_Handle_Value_Indication from the IUT containing the Analog characteristic handle and value.

  7. Verify that the characteristic value meets the requirements of the Automation IO Service and the value set/given by the Upper Tester.

  8. If required perform an action to stop indications and then repeat steps 5-7 until the Lower Tester receives additionally at least one more indication.

  9. The Lower Tester configures the Analog or Aggregate characteristic to disable indications.

  10. Repeat steps 1-2 with indications disabled.

  11. Verify that the Lower Tester does not receive an ATT_Handle_Value_Indication from the IUT containing the Analog or Aggregate characteristic.

- **Expected Outcome**

  **Pass verdict**

  If a Trigger Setting descriptor is used to enable the indication, two responses are valid for the writing of the Trigger Setting Condition value:

  - The IUT returns the error code “Trigger condition value not supported” (see [3] 1.6). In this case, test execution shall cease with a PASS verdict applied.
The IUT accepts the value written and the test continues.

The IUT sends one or more indications of the Analog or Aggregate characteristic.

The value of each field of the characteristic meets the requirements of the Automation IO Service has the same value as given/set by the Upper Tester.

The IUT stops sending indications of the Analog or Aggregate characteristic after the Lower Tester configures the characteristic to disable indications.

*Table 4.12: Analog Indication Test Cases*
# 5 Test Case Mapping

If the Automation IO Service feature AIOS y/x (see in “Item”) is supported, mark it in the “Support” field, where y corresponds to the table and x corresponds to the feature number in the ICS table.

If a feature is supported corresponding to the logical connection in the “Item” field, the corresponding test case(s) are applicable.

For Automation IO Service features refer to the ICS proforma for Automation IO Service document [4].

For purpose and structure of the ICS proforma and instructions for completing the ICS proforma refer to the Bluetooth ICS proforma document.
