Basic Imaging Profile (BIP)

Bluetooth® Test Suite

- Revision: BIP.TS.1.2.1.0
- Revision Date: 2018-11-21
- Group Prepared By: BTI
- Feedback Email: bti-main@bluetooth.org

Abstract:
This document defines test structures and procedures for interoperability testing of Bluetooth devices implementing the Basic Imaging Profile.

Use of this specification is your acknowledgement that you agree to and will comply with the following notices and disclaimers. You are advised to seek appropriate legal, engineering, and other professional advice regarding the use, interpretation, and effect of this specification.

Use of Bluetooth specifications by members of Bluetooth SIG is governed by the membership and other related agreements between Bluetooth SIG and its members, including those agreements posted on Bluetooth SIG's website located at www.bluetooth.com. Any use of this specification by a member that is not in compliance with the applicable agreements and other related agreements is prohibited and, among other things, may result in (i) termination of the applicable agreements and (ii) liability for infringement of the intellectual property rights of Bluetooth SIG and its members.

Use of this specification by anyone who is not a member of Bluetooth SIG is prohibited and is an infringement of the intellectual property rights of Bluetooth SIG and its members. The furnishing of this specification does not grant any license to any intellectual property of Bluetooth SIG or its members. THIS SPECIFICATION IS PROVIDED "AS IS" AND BLUETOOTH SIG, ITS MEMBERS AND THEIR AFFILIATES MAKE NO REPRESENTATIONS OR WARRANTIES AND DISCLAIM ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING ANY WARRANTIES OF MERCHANTABILITY, TITLE, NON-INFRINGEMENT, FITNESS FOR ANY PARTICULAR PURPOSE, OR THAT THE CONTENT OF THIS SPECIFICATION IS FREE OF ERRORS. For the avoidance of doubt, Bluetooth SIG has not made any search or investigation as to third parties that may claim rights in or to any specifications or any intellectual property that may be required to implement any specifications and it disclaims any obligation or duty to do so.

TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW, BLUETOOTH SIG, ITS MEMBERS AND THEIR AFFILIATES DISCLAIM ALL LIABILITY ARISING OUT OF OR RELATING TO USE OF THIS SPECIFICATION AND ANY INFORMATION CONTAINED IN THIS SPECIFICATION, INCLUDING LOST REVENUE, PROFITS, DATA OR PROGRAMS, OR BUSINESS INTERRUPTION, OR FOR SPECIAL, INDIRECT, CONSEQUENTIAL, INCIDENTAL OR PUNITIVE DAMAGES, HOWEVER CAUSED AND REGARDLESS OF THE THEORY OF LIABILITY, AND EVEN IF BLUETOOTH SIG, ITS MEMBERS OR THEIR AFFILIATES HAVE BEEN ADVISED OF THE POSSIBILITY OF THE DAMAGES.

If this specification is a prototyping specification, it is solely for the purpose of developing and using prototypes to verify the prototyping specifications at Bluetooth SIG sponsored IOP events. Prototyping Specifications cannot be used to develop products for sale or distribution and prototypes cannot be qualified for distribution.

Products equipped with Bluetooth wireless technology ("Bluetooth Products") and their combination, operation, use, implementation, and distribution may be subject to regulatory controls under the laws and regulations of numerous countries that regulate products that use wireless non-licensed spectrum. Examples include airline regulations, telecommunications regulations, technology transfer controls and health and safety regulations. You are solely responsible for complying with all applicable laws and regulations and for obtaining any and all required authorizations, permits, or licenses in connection with your use of this specification and development, manufacture, and distribution of Bluetooth Products. Nothing in this specification provides any information or assistance in connection with complying with applicable laws or regulations or obtaining required authorizations, permits, or licenses.

Bluetooth SIG is not required to adopt any specification or portion thereof. If this specification is not the final version adopted by Bluetooth SIG's Board of Directors, it may not be adopted. Any specification adopted by Bluetooth SIG's Board of Directors may be withdrawn, replaced, or modified at any time. Bluetooth SIG reserves the right to change or alter final specifications in accordance with its membership and operating agreements.

1 Scope

This Bluetooth document contains the Test Suite Structure (TSS) and Test Cases (TC) to test the Basic Imaging Profile (BIP).

The objective of this test suite is to provide a basis for interoperability tests for Bluetooth devices giving a high probability of air interface interoperability between different manufacturers' Bluetooth devices.
2 References, Definitions, and Abbreviations

2.1 References
This Bluetooth document incorporates, by dated or undated reference, provisions from other publications. These normative references are cited at the appropriate places in the text and the publications are listed hereafter.

[1] Bluetooth Core Specification v2.0 or later
[2] Basic Imaging Profile Specification
[3] Serial Port Profile Test Suite, SPP.TS
[5] Implementation Conformance Statement for Basic Imaging Profile, BIP.ICS
[7] Bluetooth Test Strategy and Terminology Overview
[9] BIP Implementation eXtra Information for Testing (IXIT)

2.2 Definitions
For the purpose of this Bluetooth document, the definitions from [1], [2], and [7] apply.

2.3 Abbreviations
For the purpose of this Bluetooth document, the abbreviations from [1], [2], and [7] apply.
3 Test Suite Structure (TSS)

3.1 Overview

Figure 3.1 shows the Basic Imaging Profile Test Suite Structure (TSS) including its groups and subgroups defined for testing.

Basic Imaging Profile Conformance Test Suite Structure

- Fundamental functional components
  - Get the imaging capabilities of a device
  - Get the list of images and related information
  - Put an image

- Feature specific functions
  - Get a monitoring image
  - Start an advanced printing operation
  - Start an archiving operation
  - Remotely control a display device

- Multi-function sequences
  - Push images
  - Pull images
  - Remotely order an advanced printing job
  - Remotely pilot a capturing device
  - Remotely pilot a display

Basic Imaging Profile Interoperability Test Suite Structure

- Select Imaging Responder
- Image Push
- Image Pull
- Advanced Printing
- Automatic Archive
- Remote Camera
- Remote Display

*Figure 3.1: TSS for the Basic Imaging Profile*

3.2 Test Grouping

The test groups are organized in two or three levels. The first level defines a basic grouping in test objectives. When more refinement is necessary in the grouping, a second level separates the basic groups into functional modules. The last level in each branch contains the standard ISO subgroups BV and BI.
### 3.2.1 Test Groups

The conformance test suit is divided into three test groups:

- **Fundamental Functional Components group**
  - Verifies the implementation of the most basic functions used by the Basic Imaging Profile – functions that serve as fundamental building blocks for a number of features specified in the profile.

- **Feature Specific Functions group**
  - Tests a number of functions that are specific to a given feature.

- **Multi-Function Sequences group**
  - Applies a number of typical message sequences to the IUT to verify its ability to properly combine the individual functions that have been checked in the Fundamental Functional Compliance and Feature Specific Functions test groups.

The interoperability test suite is divided in seven protocol groups organized by features as defined in [2].

- Select an Imaging Responder:
  - Image Push
  - Image Pull
  - Advanced Image Printing
  - Automatic Archive
  - Remote Camera
  - Remote Display

### 3.2.2 Test Sub Groups

The conformance test suite is further divided into sub groups that target one function or a class of functions with similar or complementary roles in the profile.
4 Test Cases (TC)

4.1 Introduction

4.1.1 Test Case Identification Conventions

Test cases shall be assigned unique identifiers per the conventions in [7]. The convention used here is `<spec abbreviation>/<IUT role>/<class>/<feat>/<func>/<subfunc>/<cap>/<xx>-<nn>-<yy>`. Bolded ID parts shall appear in the order prescribed. Non-bolded ID parts (if applicable) shall appear between the bolded parts. The order of the non-bolded parts may vary from test suite to test suite, but shall be consistent within each individual test suite.

Testing of BIP functionality includes a set of tests from the GOEP test suite. The required GOEP tests are referred to in this TCMT per the following convention `<spec abbreviation>/<IUT role>/GOEP/<GOEP TC Identification>`.

<table>

4.1.2 Conformance

When conformance is claimed, all capabilities indicated as mandatory for this Specification shall be supported in the specified manner (process-mandatory). This also applies for all optional and conditional capabilities for which support is indicated. All mandatory capabilities, and optional and conditional capabilities for which support is indicated, are subject to verification as part of the Bluetooth Qualification Program.

The Bluetooth Qualification Program may employ tests to verify implementation robustness. The level of implementation robustness that is verified varies from one Specification to another and may be revised for cause based on interoperability issues found in the market.

Such tests may verify:

- That claimed capabilities may be used in any order and any number of repetitions that is not excluded by the Specification, OR
- That capabilities enabled by the implementations are sustained over durations expected by the use case, OR
- That the implementation gracefully handles any quantity of data expected by the use case, OR
- That in cases where more than one valid interpretation of the Specification exist, the implementation complies with at least one interpretation and gracefully handles other interpretations OR
- That the implementation is immune to attempted security exploits.

A single execution of each of the required tests is required in order to constitute a pass verdict. However, it is noted that in order to provide a foundation for interoperability, it is necessary that a qualified implementation consistently and repeatedly pass any of the applicable tests.

In any case, where a member finds an issue with the Test Plan Generator, the Test Case as described in the Test Suite, or with the Test System utilized, the Member is required to notify the responsible party via an errata request such that the issue may be addressed.
4.1.3 Configurations

The following notations are used to represent the process of putting the equipment in the proper initial condition.

In cases where the test case only makes sense in a primary connection, the representation is:

![Diagram of primary connection](image)

In cases where the test case could make sense either in a primary or a secondary connection depending on the Basic Imaging Profile feature, the representation is:

![Diagram of possible connections](image)

For a test case to pass in a primary connection, the above notations translate into:

![Diagram of primary connection with details](image)
Basic Imaging Profile (BIP) / Test Suite

(The Imaging Client of the test case is the Primary Client. The Imaging Server is the Primary Server.)

For a test case to pass in a secondary connection, the above notations translate into:

(The Imaging Client of the test case is the Secondary Client and the Imaging Server is the Secondary Server.)

The OBEX service to target is determined by the section of the Test Case Mapping Table (TCMT). Some test cases make sense only in one specific OBEX service, in which case the target service is indicated on the arrow in the MSC. For test cases that can be applied to various OBEX services:

If the test case mapping indicates the Image Push is supported, the target OBEX service is the Basic Imaging Image Push service.

If the test case mapping indicates the Image Pull is supported, the target OBEX service is the Basic Imaging Image Pull service.

If the test case mapping indicates the Advanced Image Printing is supported, the target OBEX service is the Basic Imaging Advanced Image Printing service.

If the test case mapping indicates the Automatic Archive is supported, the target OBEX service is the Basic Imaging Automatic Archive service.

If the test case mapping indicates the Remote Camera is supported, the target OBEX service is the Basic Imaging Remote Camera service.

If the test case mapping indicates the Remote Display is supported, the target OBEX service is the Basic Imaging Remote Display service.
4.1.4 Pass/Fail Verdict Conventions

Each test case has an Expected Outcome section, which outlines all the detailed pass criteria conditions that shall be met by the IUT to merit a Pass Verdict.

The convention in this test suite is that, unless there are a specific set of fail conditions outlined in the test case, the IUT fails the test case as soon as one of the pass criteria conditions cannot be met. If this occurs the outcome of the test shall be the Fail Verdict.

4.2 Fundamental Functional Components

Test Group with the objective to verify Fundamental Functional Components which are functions that are used in several features and reflect the most basic capabilities of a Bluetooth imaging device.

4.2.1 Fundamental Functional Components

Test Subgroup with the objective to verify that the retrieval of the imaging-capabilities object is carried out correctly.

4.2.1.1 Get Imaging Capabilities – Client Side

- Test Purpose
  Verify that the IUT, after connection to the OBEX Image Push, Image Pull, Advanced Image Printing, Archived Objects, or Remote Display service of the Lower Tester, can request and receive the imaging-capabilities object from the Lower Tester.

- Test Case ID(s)
  - BIP/IPSI/FFC/BV-01-C
  - BIP/IPLI/FFC/BV-01-C
  - BIP/AIPI/FFC/BV-01-C
  - BIP/AAR/FFC/BV-01-C
  - BIP/RDI/FFC/BV-01-C

- Reference
  [2] 4.4.6.3, 4.5.1

- Initial Condition
  There shall be an active OBEX imaging session (Image Push, Image Pull, Advanced Image Printing, Archived Objects, or Remote Display service) where the IUT is the OBEX client and the Lower Tester is the OBEX server.

- Test Procedure
  The IUT sends a GetCapabilities request to the Lower Tester.
• Expected Outcome

Pass verdict:

The GetCapabilities request shall be correctly understood by the Lower Tester. The Lower Tester will verify the existence and validity of the ConnectionID and Type headers. The ConnectionID shall be the one assigned by the Lower Tester upon opening the Imaging service session. The Type header shall be set to “x-bt/img-capabilities”.

The IUT shall be able to correctly receive the response issued by the Lower Tester (i.e. not report an error upon receiving the response).

4.2.1.2 Get Imaging Capabilities – Server Side

• Test Purpose

Verify that the IUT, when connected through an OBEX imaging service (Image Push, Image Pull, Advanced Image Printing, Archived Objects, or Remote Display service), can accurately return to the Lower Tester its local imaging-capabilities object.

• Test Case ID(s)

BIP/IPSR/FFC/BV-02-C
BIP/IPLR/FFC/BV-02-C
BIP/AIPR/FFC/BV-02-C
BIP/AAI/FFC/BV-02-C
BIP/RDR/FFC/BV-02-C

• Reference

[2] 4.4.6.3, 4.5.1
• Initial Condition

There shall be an active OBEX imaging session (Image Push, Image Pull, Advanced Image Printing, Archived Objects, or Remote Display service) where the IUT is the OBEX server and the Lower Tester is the OBEX client.

• Test Procedure

The Lower Tester issues a GetCapabilities request.

• Test Condition

The IUT shall have a non-empty imaging-capabilities object.

• Expected Outcome

**Pass verdict:**

A Success response containing a non-empty imaging-capabilities object is returned by the IUT.

The GetCapabilities response is well formatted.

- All of the elements are enumerated in the imaging-capabilities object according to the features that are supported by the IUT (based on ICS/IXIT).
- The SDP record advertises correct features and matches what is claimed as supported by the IUT (based on ICS/IXIT).

• Notes

When possible, try to verify that the content of each element/attribute in the imaging-capabilities object is accurate by comparing it with the ICS [5] (see the Image Push service, the Image Pull service, the Advanced Image Printing service, the Archived Objects service and the Remote Display service).

4.2.2 Get the List of Images and Related Information

Test Subgroup with the objective to verify that the functions related with the images-listing object are correctly implemented.
4.2.2.1 BIP/IPLI/FFC/BV-03-C [Get Images List – Client Side]

- **Test Purpose**
  Verify that the IUT, when connected to an imaging service of the Lower Tester (Image Pull, Remote Display, or Archived Objects service), can correctly request and receive the images list from the Lower Tester.

- **Reference**
  [2] 4.4.6.1, 4.5.6

- **Initial Condition**
  There shall be an active OBEX imaging session (Image Push, Image Pull, or Archived Objects) where the IUT is the OBEX client and the Lower Tester is the OBEX server.

- **Test Procedure**

  The IUT sends a GetImagesList request to the Lower Tester.

  - **Expected Outcome**
    **Pass verdict:**
    The GetImagesList request shall be well formatted. The Lower Tester will specifically verify the presence, validity, and order of the ConnectionID, Type, Application Parameters, and Img-Description headers. The ConnectionID shall be the one assigned by the Lower Tester upon opening the Imaging service session. The Type header shall be set to “x-bt/img-listing”. The NbReturnedHandles Application Parameters header shall be non-null. The ListStartOffset Application Parameters header shall be set to 0.
    The IUT shall be able to correctly receive the response issued by the Lower Tester and in particular shall not report an error upon receiving the response.
### 4.2.2.2 Get Images List – Server Side

- **Test Purpose**
  Verify that the IUT, when connected to by the Lower Tester through an imaging service (Image Pull, Remote Display, or Archived Objects service), can, upon request, provide its images list to the Lower Tester.

- **Test Case ID(s)**
  
  - BIP/IPL/FFC/BV-04-C
  - BIP/AAI/FFC/BV-04-C
  - BIP/RDR/FFC/BV-04-C

- **Reference**
  [2] 4.4.6.1, 4.5.6

- **Initial Condition**
  There shall be an active OBEX imaging session (Image Pull, Remote Display, or Archived Objects service) where the IUT is the OBEX server and the Lower Tester is the OBEX client.

  The IUT shall have at least one image stored locally.

- **Test Procedure**
  The Lower Tester issues a GetImagesList request. The Img-Description header is left empty (i.e. no filtering is requested by the Lower Tester). The NbReturnedHandles is non-null. The LatestCapturedImages flag is set to 0.

- **Expected Outcome**
  **Pass verdict:**

  The IUT returns a GetImagesList response that is well formatted. The Lower Tester will verify the presence and validity of the Application Parameters, Img-Description, and Body headers. The NbReturnedHandles header shall be accurate (i.e. correspond to the number of handles actually returned in the images-listing object). The image-handles-descriptor shall be empty or absent.

  The number of images returned in the images-listing object is correctly reflected in the NbReturnedHandles header value.

#### 4.2.2.3 BIP/IPL/FFC/BV-05-C [Get Total Number of Images – Client Side]

- **Test Purpose**
  Verify that the IUT can connect to an imaging service of the Lower Tester (Image Pull, Remote Display, or Archived Objects service) can correctly request and receive the total number of images available on the Lower Tester.

- **Reference**
  [2] 4.4.6.1, 4.5.6
Basic Imaging Profile (BIP) / Test Suite

- **Initial Condition**

  There shall be an active OBEX imaging session (Image Pull, Remote Display, or Archived Objects service) where the IUT is the OBEX client and the Lower Tester is the OBEX server.

- **Test Procedure**

  The IUT issues a GetImagesList request with 0 as value for the NbReturnedHandles Application Parameters header. The Img-Descriptor is left empty (i.e. no filtering is requested by the Lower Tester). The LatestCapturedImages flag is set to 0.

- **Expected Outcome**

  Pass verdict:
  
The Lower Tester is able to recognize the request for the total number of available images. The Lower Tester will verify the presence and validity of the Application Parameters, Img-Description, and Body headers. The NbReturnedHandles header shall be accurate (i.e. correspond to the number of handles actually returned in the images-listing object). The image handles descriptor shall be empty.

  The IUT correctly receives the response from the Lower Tester and in particular doesn’t report any error upon receiving the response.

4.2.2.4 BIP/IPLR/FFC/BV-06-C [Get Total Number of Images – Server Side]

- **Test Purpose**

  Verify that the IUT, when connected to by the Lower Tester through an imaging service (Image Pull, Remote Display, or Archived Objects service), can, upon request, provide the total number of available images.

- **Reference**

  [2] 4.4.6.1, 4.5.6

- **Initial Condition**

  There shall be an active OBEX imaging session (Image Pull, Remote Display, or Archived Objects service) where the IUT is the OBEX server and the Lower Tester is the OBEX client.

  The IUT shall have more than one image locally stored.

- **Test Procedure**

  The Lower Tester issues a GetImagesList request with 0 as the NbReturnedHandles Application Parameters header. The LatestCapturedImages flag is set to 0.

- **Expected Outcome**

  Pass verdict:
  
The IUT returns a GetImagesList response that is well formatted. The Lower Tester will specifically verify that the Body header contains an empty images-listing object.

  The NbReturnedHandles header’s value shall correspond to the total number of images that are locally available for transfer via Bluetooth.
4.2.2.5 BIP/IPLI/FFC/BV-07-C [Get the List of Recently Captured Images – Client Side]

- **Test Purpose**
  Verify that the IUT can connect to an imaging service of the Lower Tester (Image Pull, Remote Display, or Archived Objects service) and correctly request and receive the list of most recently captured images on the Lower Tester.

- **Reference**
  [2] 4.4.6.1, 4.5.6

- **Initial Condition**
  There shall be an active OBEX imaging session (Image Pull, Remote Display, or Archived Objects) where the IUT is the OBEX client and the Lower Tester is the OBEX server.

- **Test Procedure**

  ![Diagram of the test procedure]

  The IUT issues a GetImagesList request with the LatestCapturedImages Application Parameters header set to 1.

- **Expected Outcome**
  **Pass verdict:**

  The Lower Tester is able to recognize the request for an ordered images-listing object that describes the most recently taken images.

  The GetImagesList request is well formatted. The Lower Tester will especially verify that the request contains a valid ConnectionID header; a Type header of “x-bt/img-listing”, a valid Application Parameters header, and a valid image handles descriptor.

  The IUT correctly receives the response from the Lower Tester and in particular doesn’t report an error upon receiving the response.
• Notes
The IUT may or may not include a non-empty image-handles-descriptor in its GetImagesList request.

4.2.2.6 BIP/IPLR/FFC/BV-08-C [Get the List of Recently Captured Images – Server Side]

• Test Purpose
Verify that the IUT, when connected to an imaging service of the Lower Tester (Image Pull, Remote Display, or Archived Objects service), can correctly return the list of its most recently captured images.

• Reference
[2] 4.4.6.1, 4.5.6

• Initial Condition
There shall be an active OBEX imaging session (Image Pull, Remote Display, or Archived Objects service) where the IUT is the OBEX server and the Lower Tester is the OBEX client.

The IUT shall have a number of locally stored images it has captured. The dates when the images were captured shall be known.

• Test Procedure
The Lower Tester issues a GetImagesList request with the LatestCapturedImages Application Parameters header set to 1.

• Expected Outcome
Pass verdict:

The IUT returns a GetImagesList response that is well formatted.

The NbReturnedHandles Application Parameters header value matches the number of handles that are actually returned in the images-listing object.

The images-listing object contains accurate information and the order of the listed handles corresponds to the chronological order of their capture.

4.2.3 Put an image
Test Subgroup with the objective to verify that the fundamental function for pushing images is correctly implemented.

4.2.3.1 Put an Image – Normal – Client Side

• Test Purpose
Verify that the IUT, when connected to an Imaging service of the Lower Tester (Image Push or Remote Display service), can correctly push an image to the Lower Tester and understand the response from the Lower Tester.
• Test Case ID(s)

**BIP/PSI/FFC/BV-09-C**

**BIP/RDI/FFC/BV-09-C**

• Reference

[2] 4.4.7.2, 4.5.2

• Initial Condition

There shall be an active OBEX imaging session (Image Push or Remote Display service) where the IUT is the OBEX client and the Lower Tester is the OBEX server.

There shall be at least one image locally stored on the IUT.

• Test Procedure

A PutImage request is issued by the IUT. The Lower Tester is not allowed to issue a Partial Content response code in response to the request.

• Expected Outcome

**Pass verdict:**

The Lower Tester recognizes the PutImage request. The Lower Tester verifies that the PutImage request contains a valid ConnectionID. The image descriptor is also checked and the information that it contains shall be accurate (the Lower Tester will open the image file to determine the properties of the image and compare them with the image-properties object).

The image descriptor that is sent in the request accurately describes the image that is sent.

The IUT properly processes the PutImage response.
4.2.3.2 Put an Image – Normal – Server Side

- **Test Purpose**
  Verify that the IUT, when connected to by the Lower Tester through its Image Push or Remote Display service, can correctly receive an image pushed by the Lower Tester.

- **Test Case ID(s)**
  - BIP/IPSR/FFC/BV-10-C
  - BIP/RDR/FFC/BV-10-C

- **Reference**
  [2] 4.4.7.2, 4.5.2

- **Initial Condition**
  There shall be an active OBEX imaging session (Image Push or Remote Display service) where the IUT is the OBEX server and the Lower Tester is the OBEX client.

- **Test Procedure**
  A PutImage request is issued by the Lower Tester.

  ![Flowchart Image]

- **Expected Outcome**
  **Pass verdict:**
  The IUT recognizes the PutImage request and accepts the image.
  The PutImage response is well formatted. The Lower Tester will specifically verify that the PutImage response contains a valid image handle.
  The IUT assigns an imaging handle to the image and returns it in the PutImage response.
• Notes
   The image sent by the Lower Tester will be in a format (encoding and size) that is known to be acceptable to the IUT. The Lower Tester chooses the format based on the IXIT.

4.2.3.3 Put an Image – Request for Thumbnail – Server Side

• Test Purpose
   Verify that the IUT, when connected to by the Lower Tester through an Imaging service (Image Push or Remote Display service), can correctly receive an image pushed by the Lower Tester and can request the Lower Tester to send the thumbnail version of the image.

• Test Case ID(s)
   BIP/IPSR/FFC/BV-11-C
   BIP/RDR/FFC/BV-11-C

• Reference
   [2] 4.5.2, 4.5.9

• Initial Condition
   There shall be an active OBEX imaging session (Image Push or Remote Display service) where the IUT is the OBEX server and the Lower Tester is the OBEX client.

• Test Procedure
   A PutImage request is issued by the Lower Tester.

   ![Diagram of PutImage with Request for Thumbnail]

   • Expected Outcome
   Pass verdict:
   The IUT recognizes the PutImage request and accepts the image.
The PutImage response issued by the IUT shall be well formatted. The Lower Tester will specifically verify that it contains a valid image handle.

The IUT assigns an imaging handle to the image and returns it in the PutImage response.

The IUT requests the imaging thumbnail corresponding to the received image via the Partial Content response code.

• Notes

It is not the object of this test purpose to verify support for the PutLinkedThumbnail function. Therefore, it is sufficient to verify that the response issued by the IUT contains the Partial Content response code.

The image sent by the Lower Tester will be in a format (encoding and size) that is known to be acceptable to the IUT and is different from the imaging thumbnail format. The formats supported by the IUT are declared in the IXIT [9] (see the Image Push service and the Remote Display service).

4.3 Feature Specific Functions
Test Group with the objective to verify that the functions that are specific to a given feature of the Basic Imaging Profile are correctly implemented.

4.3.1 Get a Monitoring Image
Test Subgroup with the objective to verify that the GetMonitoring function is correctly implemented.

4.3.1.1 BIP/RCI/FSF/BV-01-C [Get a Monitoring Image – Image Not Saved – Client Side]

• Test Purpose

Verify that the IUT, when connected to the Remote Camera service of the Lower Tester, can correctly request and receive monitoring images where the request does not trigger capturing the full size image.

• Reference

[2] 4.4.6.5, 4.5.16

• Initial Condition

There shall be an active OBEX Remote Camera Service session where the IUT is the OBEX client and the Lower Tester is the OBEX server.

• Test Procedure

The IUT issues a GetMonitoringImage request with StoreFlag set to 0x00.

In response, the Lower Tester issues a GetMonitoringImage response with no Img-Handle header.
• Expected Outcome

Pass verdict:

The Lower Tester recognizes the GetMonitoringImage requests and they shall be well formatted. The Lower Tester will specifically verify that the GetMonitoringImage request contains a valid ConnectionID, a Type header of “x-bt/img-monitoring”, and a StoreFlag Application Parameters header.

The IUT correctly processes the GetMonitoringImage response and in particular does not report an error upon receiving the response.

• Notes

The Lower Tester, if not equipped with an image capture capability, shall be able to simulate monitoring images.

4.3.1.2 BIP/RCI/FSF/BV-02-C [Get a Monitoring Image – Image Saved – Client Side]

• Test Purpose

Verify that the IUT, when connected to the Remote Camera service of the Lower Tester, can correctly request and receive monitoring images where the request triggers capturing the full size image.

• Reference

[2] 4.4.6.5, 4.5.16

• Initial Condition

There shall be an active OBEX Remote Camera Service session where the IUT is the OBEX client and the Lower Tester is the OBEX server.

• Test Procedure

The IUT issues a GetMonitoringImage request with StoreFlag set to 0x01.

• Expected Outcome

Pass verdict:

The Lower Tester recognizes the GetMonitoringImage requests. The Lower Tester will specifically verify that the GetMonitoringImage request contains a valid ConnectionID, a Type header of “x-bt/img-monitoring”, and a StoreFlag Application Parameters header.

The StoreFlag value is set to 0x01.

The Lower Tester is returns a monitoring image. The GetMonitoringImage response contains an Img-Handle header that corresponds to the full size image available on the Lower Tester.

The IUT correctly processes the GetMonitoringImage response and in particular does not report an error upon receiving of the response.
• Notes
The Lower Tester, if not equipped with an image capture capability, shall be able to simulate
monitoring images.

4.3.1.3 BIP/RCR/FSF/BV-03-C [Get a Monitoring Image – Image Not Saved – Server Side]

• Test Purpose
Verify that the IUT, when connected to by the Lower Tester through its Remote Camera service, can
correctly return monitoring images to the Lower Tester without saving them or saving the
corresponding full size images.

• Reference
[2] 4.4.6.5, 4.5.16

• Initial Condition
There shall be an active OBEX Remote Camera service session where the IUT is the OBEX server
and the Lower Tester is the OBEX client.

• Test Procedure
The Lower Tester issues a GetMonitoringImage request with StoreFlag set to 0x00.

GET Request: GetMonitoringImage
(Image, StoreFlag not set)
GET Response: Success(MonitoringImage)
IUT Lower Tester
GetMonitoring
Image, image 
saved
Imaging
Client
Imaging
Server
Connection establishment ( Remote 
Camera service)
GET Request: GetMonitoringImage
(Image, StoreFlag not set)
GET Response: Success(MonitoringImage)

• Expected Outcome
Pass verdict:
The IUT recognizes the GetMonitoringImage requests.

The IUT returns a GetMonitoringImage response that is well formatted. The Lower Tester will
specifically verify that the response includes a monitoring image and an empty Img-Handle header.
4.3.1.4  BIP/RCR/FSF/BV-04-C [Get a Monitoring Image – Image Saved – Server Side]

- **Test Purpose**
  Verify that the IUT, when connected to by the Lower Tester through its Remote Camera service, can correctly return monitoring images to the Lower Tester and save the corresponding full size images.

- **Reference**
  [2] 4.4.6.5, 4.5.16

- **Initial Condition**
  There shall be an active OBEX Remote Camera service session where the IUT is the OBEX server and the Lower Tester is the OBEX client.

- **Test Procedure**
  The Lower Tester issues a GetMonitoringImage request with StoreFlag set to 0x01.

- **Expected Outcome**
  **Pass verdict:**
  The IUT recognizes the GetMonitoringImage requests.
  The IUT returns a GetMonitoringImage response that is well formatted. The Lower Tester will specifically verify that the response includes a monitoring image and an Img-Handle header with a valid image handle.
  In the GetMonitoringImage response, there is an Img-Handle header corresponding to the full size image that was stored as result of the GetMonitoringImage request.
  The Lower Tester correctly processes the GetMonitoringImage response.

- **Notes**
  If possible, verify that the image handle that is returned by the IUT corresponds to the correct image.

4.3.2  **Start Advanced Printing**

Test Subgroup with the objective to verify that the StartPrinting image is correctly implemented.

4.3.2.1  BIP/AIPI/FSF/BV-05-C [Start Advanced Printing – Client Side]

- **Test Purpose**
  Verify that the IUT, when connected to the Advanced Image Printing service of the Lower Tester, can initiate a print job by sending a printer control object to the Lower Tester and understand the response.

- **Reference**
  [2] 4.4.6.4, 4.5.12
**Basic Imaging Profile (BIP) / Test Suite**

- **Initial Condition**
  There shall be an active OBEX Advanced Image Printing service session where the IUT is the OBEX client and the Lower Tester is the OBEX server.

  There shall be at least one image on the IUT so the printer control object is not empty.

- **Test Procedure**
  The IUT builds a printer control object with at least one print job and sends it via a StartPrint request.

- **Expected Outcome**
  **Pass verdict:**
  The Lower Tester recognizes the StartPrint request and it’s well formatted. The Lower Tester will specifically verify that the StartPrint request contains a valid ConnectionID, a Type header of "x-bt/img-print", an Application Parameter with a valid ServiceID, and a well formatted printer control object.

  The IUT can correctly process the StartPrint response and in particular does not report an error upon receiving the response.

  The Lower Tester initiates a secondary connection to the OBEX Referenced Objects service of the IUT. In this session, the Lower Tester is the OBEX client and the IUT is OBEX the server.

- **Notes**
  Verifying the behavior of the IUT upon receiving a Connection request for a secondary connection is out of scope for this test.

### 4.3.2.2 **BIP/AIPR/FSF/BV-06-C [Start Advanced Printing – Server Side]**

- **Test Purpose**
  Verify that the IUT, when connected to by the Lower Tester through its Advanced Image Printing service, can correctly receive a print job and initiate the requested printing operation.

- **Reference**
  [2] 4.4.6.4, 4.5.12

- **Initial Condition**
  There shall be an active OBEX Advanced Image Printing service session where the IUT is the OBEX server and the Lower Tester is the OBEX client.

- **Test Procedure**
  The Lower Tester builds a printer control object with at least one print job and sends it via a StartPrint request to the IUT.

- **Expected Outcome**
  **Pass verdict:**
  The IUT can recognize the StartPrint request and issues a StartPrint response.
The Lower Tester can correctly process the StartPrint response and it’s well formatted.

- Notes
  The IUT may or may not initiate a Connection request for a secondary connection – this is out of scope for this test.

### 4.3.3 Start Archiving
Test Subgroup with the objective to verify that the StartArchive function is correctly implemented.

#### 4.3.3.1 BIP/AAI/FSF/BV-07-C [Start Archiving – Client Side]
- Test Purpose
  Verify that the IUT, when connected to the Automatic Archive service of the Lower Tester, can command the Lower Tester to start archiving the images stored locally on the IUT and understand the response from the Lower Tester.

- Reference
  [2] 4.5.14

- Initial Condition
  There shall be an active OBEX Automatic Archive service session where the IUT is the OBEX client and the Lower Tester is the OBEX server.

- Test Procedure
  The IUT issues a StartArchive request.

- Expected Outcome
  **Pass verdict:**

  The Lower Tester can correctly recognize the StartArchive request and it’s well formatted. The Lower Tester will verify the presence of a valid ConnectionID, a Type header of “x-bt/img-archive”, and a valid ServiceID.

  The IUT can correctly process the StartArchive response and in particular does not report an error upon receiving the response.

#### 4.3.3.2 BIP/AAR/FSF/BV-08-C [Start Archiving – Server Side]
- Test Purpose
  Verify that the IUT, when connected to by the Lower Tester through its Automatic Archive service, can correctly receive a request for an Automatic Archive job.

- Reference
  [2] 4.5.14
• Initial Condition

There shall be an active OBEX Automatic Archive service session where the IUT is the OBEX server and the Lower Tester is the OBEX client. There shall be at least one image available on the Lower Tester.

• Test Procedure

The Lower Tester issues a StartArchive request.

• Expected Outcome

Pass verdict:

The IUT recognizes the StartArchive request and issues a StartArchive response.

The Lower Tester correctly processes the StartArchive response and it’s well formatted.

4.3.4 Remotely Control a Display

Test Subgroup with the objective to verify that the RemoteDisplay function is correctly implemented.

4.3.4.1 BIP/RDI/FSF/BV-09-C [Go to Next Image – Client Side]

• Test Purpose

Verify that the IUT, when connected to the Remote Display service of the Lower Tester, can correctly order the Lower Tester to display the next image and understand the response from the Lower Tester.

• Reference

[2] 4.5.5

• Initial Condition

There shall be an active OBEX Remote Display Service session where the IUT is the OBEX client and the Lower Tester is the OBEX server.

The Lower Tester shall be able to emulate a display. The Lower Tester has at least two locally available images and those images are ordered (the order is at the discretion of the Lower Tester).

• Test Procedure

The IUT issues a RemoteDisplay request with NextImage as the RemoteDisplay Application Parameters header.

• Expected Outcome

Pass verdict:

The Lower Tester recognizes the RemoteDisplay request and it’s well formatted. The Lower Tester will specifically verify that the RemoteDisplay request includes a valid ConnectionID, a Type header of “x-bt/img-display”, an empty Img-Handle header, and a valid Application Parameters header with NextImage as its value.
The IUT correctly processes the RemoteDisplay response and in particular does not report an error upon receiving the response.

4.3.4.2 BIP/RDI/FSF/BV-10-C [Go to Previous Image – Client Side]

- **Test Purpose**
  Verify that the IUT, when connected to the Remote Display service of the Lower Tester, can correctly order the Lower Tester to display the previous image and understand the response from the Lower Tester.

- **Reference**
  [2] 4.5.5

- **Initial Condition**
  There shall be an active OBEX Remote Display Service session where the IUT is the OBEX client and the Lower Tester is the OBEX server.

  The Lower Tester shall be able to emulate a display. The Lower Tester has at least two locally available images and those images are ordered (the order is at the discretion of the Lower Tester).

- **Test Procedure**

  The IUT issues a RemoteDisplay request with PreviousImage as the RemoteDisplay Application Parameters header.

  - **Expected Outcome**
    **Pass verdict:**

    The Lower Tester recognizes the RemoteDisplay request and it's well formatted. The Lower Tester will specifically verify that the RemoteDisplay request includes a valid ConnectionID, a Type header of “x-bt/img-display“, an empty Img-Handle header, and a valid Application Parameters header with PreviousImage as its value.
The IUT correctly processes the RemoteDisplay response and in particular does not report an error upon receiving the response.

4.3.4.3 BIP/RDR/FSF/BV-11-C [Go to Next Image – Server Side]

- **Test Purpose**
  Verify that the IUT, when connected through its Remote Display service by the Lower Tester, can correctly display the next image.

- **Reference**
  [2] 4.5.5

- **Initial Condition**
  There shall be an active Remote Display Service session where the IUT is the OBEX server and the Lower Tester is the OBEX client.

  The IUT shall have at least two locally available images and those images are ordered (the order is at the discretion of the IUT). The IUT shall be displaying the first image.

- **Test Procedure**
  The Lower Tester issues two RemoteDisplay requests with NextImage as the RemoteDisplay Application Parameters header.

  - **Expected Outcome**
    Pass verdict:
    The IUT recognizes the RemoteDisplay request.

    Upon receiving the first RemoteDisplay request, the IUT displays an image. Upon receiving the second RemoteDisplay request, the IUT displays another image.

    The Lower Tester correctly processes the RemoteDisplay responses and they're well formatted. The Lower Tester will specifically verify that the responses contain a valid image handle.
4.3.4.4 BIP/RDR/FSF/BV-12-C [Go to Previous Image – Server Side]

- **Test Purpose**
  Verify that the IUT, when connected to by the Lower Tester through its Remote Display service, can correctly display the previous image.

- **Reference**
  [2] 4.5.5

- **Initial Condition**
  There shall be an active Remote Display Service session where the IUT is the OBEX server and the Lower Tester is the OBEX client.

  The IUT shall have at least two locally available images and those images are ordered (the order is at the discretion of the IUT). The IUT shall be displaying the last image.

- **Test Procedure**
  The Lower Tester issues two RemoteDisplay requests with PreviousImage as the RemoteDisplay Application Parameters header.

- **Expected Outcome**
  **Pass verdict:**

  The IUT recognizes the RemoteDisplay request.

  Upon receiving the first RemoteDisplay request, the IUT displays an image. Upon receiving the second RemoteDisplay request, the IUT displays another image.

  The Lower Tester correctly processes the RemoteDisplay responses and they're well formatted. The Lower Tester will specifically verify that the responses contain a valid image handle.

4.4 Multi Functions Sequences

Test Group with the objective to submit to the IUT a number of typical function sequences. As is the case for the functional tests, these tests are not meant to be absolutely exhaustive, but exercise a number of typical situations that the IUT ought to handle properly.

4.4.1 Push Images

Test Subgroup with the objective to verify that the IUT is capable of pushing images or receiving images as defined in the Image Push feature and the Remote Display feature in respectively Sections 4.3.1 and 4.3.6 of [2].

4.4.1.1 BIP/PSI/MFS/BV-01-C [Use the Capabilities Object to Put Images – Client Side]

- **Test Purpose**
  Verify that the linkage between the GetCapabilities function and the PutImage function is correct (i.e. that the IUT sends images according to the image-formats element in the Lower Tester’s imaging-capabilities object).
• Reference

[2] 4.4.6.3, 4.5.1, 4.5.2

• Initial Condition

There shall be an active OBEX session (Image Push or Remote Display service) where the IUT is the OBEX client and the Lower Tester is the OBEX server.

The IUT shall have at least one image stored locally and available to be pushed. If the IUT supports encodings or sizes other than imaging thumbnail, the image shall not be a thumbnail.

• Test Procedure

The above sequence is repeated three times with the following variations on the imaging-capabilities object; this may include disconnection of the OBEX channel for each iteration.

The imaging-capabilities object indicates that JPEG160*120 is the sole image encoding/size supported by the Lower Tester.

The imaging-capabilities object indicates support for one and only one of the encodings supported by the IUT and all possible sizes (“1*1-65535*65535”). Supported encodings are indicated in the IXIT [9], for the Image Push service and the Remote Display service.

The imaging-capabilities object indicates support for all the encodings supported by the IUT and one size chosen among those supported by the IUT. Supported encodings and sizes are indicated in the IXIT [9], for the Image Push service and the Remote Display service.

• Expected Outcome

**Pass verdict:**

Upon receiving the first GetCapabilities response, the IUT issues a PutImage request that contains an imaging thumbnail as the body and an accurate image descriptor.

Upon receiving the second GetCapabilities response, the IUT issues a PutImage request that contains an image using an encoding indicated as supported by the Lower Tester. The image can be of any size.

Upon receiving the third GetCapabilities response, the IUT issues a PutImage request that contains an image using a size indicated as supported by the Lower Tester. The encoding is chosen by the IUT.

• Notes

The GetCapabilities function is tested in Get Imaging Capabilities – Client Side.

The PutImage function is tested in Put an Image – Normal – Client Side.
4.4.1.2 BIP/PSR/MFS/BV-02-C [Accurately Provide the Capability Object – Server Side]

- **Test Purpose**
  Verify that the linkage between the GetCapabilities function and the PutImage function is correct (i.e. that the IUT does support the image formats it advertises in its imaging-capabilities object).

- **Reference**
  [2] 4.4.6.3, 4.5.1, 4.5.2

- **Initial Condition**
  There shall be an active OBEX session (Image Push or Remote Display service) where the IUT is the OBEX server and the Lower Tester is the OBEX client.

- **Test Procedure**

  ![Diagram]

  The Lower Tester, upon receiving the imaging-capabilities object from the IUT, will pick at random one of the encodings/sizes described as supported by the IUT and send an image to the IUT in that format.

- **Expected Outcome**
  **Pass verdict:**
  The image sent by the Lower Tester is correctly received by the IUT.

  If the IUT is in a Remote Display session, the displayed image shall not change as the result of pushing a new image.
• Notes

The GetCapabilities function is tested in Get Imaging Capabilities – Server Side.

The PutImage function is tested in Put an Image – Normal – Server Side.

4.4.1.3 BIP/IPS/MFS/BV-03-C [Accurately Push a Thumbnail – Client Side]

• Test Purpose

Verify the linkage between the PutImage function and the PutLinkedThumbnail function (i.e. that IUT can send the thumbnail corresponding to the image previously sent to the Lower Tester).

• Reference

[2] 4.5.2, 4.5.3

• Initial Condition

There shall be an active OBEX session (Image Push or Remote Display service) where the IUT is the OBEX client and the Lower Tester is the OBEX server.

The IUT shall have at least one image locally stored and available for pushing to the Lower Tester in a format different from the imaging thumbnail format.

• Test Procedure

The following sequence is executed:

The IUT issues a PutImage request containing an image to send to the Lower Tester. The image is not an imaging thumbnail.
The Lower Tester responds to the PutImage request with a PutImage response containing the image handle assigned to the received image and a Partial Content response code.

IUT issues a PutLinkedThumbnail request containing the thumbnail that corresponds to the previously transmitted image with its image handle.

The Lower Tester responds with Success response code to the PutLinkedThumbnail request.

• Expected Outcome
  
  **Pass verdict:**
  
The image sent by the IUT in the PutImage Request is not an imaging thumbnail.

  The IUT issues a PutLinkedThumbnail request containing the thumbnail corresponding to the previously transmitted image. The Lower Tester will specifically verify that the PutLinkedThumbnail request contains a valid ConnectionID and a Type header of “x-bt/img-thm”.

  The PutLinkedThumbnail request shall be issued immediately upon receiving the PutImage request.

  The image handle contained in the PutLinkedThumbnail request from the IUT is the same as the one in the PutImage response from the Lower Tester.

• Notes
  
The image handle for the transmitted image is assigned randomly by the Lower Tester.

  The PutImage function is tested in Put an Image – Normal – Client Side.

**4.4.1.4 BIP/IPS/MFS/BV-04-C [Request a Thumbnail – Server Side]**

• Test Purpose
  
  Verify the linkage between the PutImage function and the PutLinkedThumbnail function (i.e. that the IUT can request a thumbnail and correctly receive and process it).

• Reference
  
  [2] 4.5.2, 4.5.3

• Initial Condition
  
  There shall be an active OBEX session (Image Push or Remote Display service) where the IUT is the OBEX client and the Lower Tester is the OBEX server.

  The image to be transmitted from the Lower Tester is a non-thumbnail image supported by IUT and for which the IUT needs a subsequent thumbnail request.
• Test Procedure

The Lower Tester issues a PutImage request to the IUT containing an image that is not an imaging thumbnail.

The IUT responds to the PutImage request with a PutImage response containing the image handle assigned to the received image and a Partial Content response code.

The Lower Tester issues a PutLinkedThumbnail request containing the thumbnail that corresponds to the previously transmitted image with its image handle.

The IUT receives the thumbnail and responds with a Success response code to the PutLinkedThumbnail request.

• Expected Outcome

Pass verdict:

The IUT responds to PutImage request with a Partial Content response code.

The IUT receives a PutLinkedThumbnail request containing the thumbnail and responds with a Success response code.

• Notes

Whenever possible, check on the IUT that the received thumbnail has been linked to the correct image.
The PutImage function is tested in Put an Image – Request for Thumbnail – Server Side.

4.4.1.5 BIP/IPSI/MFS/BV-05-C [Push an Attachment – Client Side]

• Test Purpose
  Verify that an IUT that pushes an image, then tries to send an associated attachment does so using the proper image handle (i.e. verify the linkage between a PutImage response and a PutLinkedAttachment request).

• Reference
  [2] 4.4.6.3, 4.5.2, 4.5.4

• Initial Condition
  There shall be an active OBEX Image Push service session where the IUT is the OBEX client and the Lower Tester is the OBEX server.

  The IUT shall have at least one image with an associated attachment that's available for transmission to the Lower Tester (supported attachment formats are declared in the IXIT [9]).

• Test Procedure
  The following sequence is executed:

  1. The IUT issues a PutImage request containing an image to the Lower Tester.
  2. The Lower Tester responds to the PutImage request with a PutImage response containing the image handle that has been assigned to the received image.
  3. The IUT issues a PutLinkedAttachment request containing an attachment file associated with the previously transmitted image along with its image handle.
  4. The Lower Tester responds with a Success response code.

• Expected Outcome
  **Pass verdict:**

  The PutLinkedAttachment request shall be well formatted. The Lower Tester will specifically verify that the PutLinkedAttachment request contains a valid ConnectionID, a Type header of “x-bt/img-attachment”, a valid image handle, a valid attachment descriptor, and the attachment file.

  The attachment descriptor shall correctly describe the attachment (the Lower Tester will open the attachment file following the indications passed on in the attachment descriptor and confirm that the information given in the attachment descriptor is accurate).

  The image handle used by the IUT in the PutLinkedAttachment request shall be the one that the Lower Tester assigned to the associated image.

• Notes
  The PutImage function is tested in Put an Image – Normal – Client Side.

4.4.1.6 BIP/IPSR/MFS/BV-06-C [Accurately Receive an Attachment – Server Side]

• Test Purpose
Verify that an IUT correctly processes the attachment files sent by the Lower Tester (i.e. verify the linkage between PutImage responses and subsequent PutLinkedAttachment operations).

- **Reference**
  [2] 4.4.6.3, 4.5.2, 4.5.4

- **Initial Condition**
  There shall be an active OBEX Image Push service session where the IUT is the OBEX server and the Lower Tester is the OBEX client.

The Lower Tester shall have knowledge of the attachment formats that the IUT supports and use only attachment files that are known to be supported (supported attachment formats are declared in the IXIT [9]).

- **Test Procedure**
1. The Lower Tester issues a PutImage request containing image #1.
2. The IUT responds to the PutImage request with a PutImage response containing the image handle assigned to image #1. Note that, depending on the implementation, the IUT might request the associated thumbnail. If this is the case, the Lower Tester will send the imaging thumbnail with a PutLinkedThumbnail operation before moving to step 3.
3. The Lower Tester issues a second PutImage request containing image #2.
4. The IUT responds to the PutImage request with a PutImage response containing the image handle assigned to image #2. Note that, depending on the implementation, the IUT might request the associated thumbnail. If this is the case, the Lower Tester will send the imaging thumbnail with a PutLinkedThumbnail operation before moving to step 5.
5. The Lower Tester issues a PutLinkedAttachment request containing the attachment file associated with image #1 together with image handle #1.
6. The IUT receives the attachment file and responds with a Success response code to the PutLinkedAttachment request.

- **Expected Outcome**
  - **Pass verdict:**
    - The PutLinkedAttachment response is well formatted.
    - The IUT correctly associates the received attachment with the proper image.

- **Notes**
  - The PutImage function is tested in **Put an Image – Normal – Server Side** and **Put an Image – Request for Thumbnail – Server Side**.

### 4.4.2 Pull Images

Test Subgroup with the objective to verify that the IUT is capable of correctly retrieving or delivering images as defined in the Image Pull, Automatic Archive, and Remote Camera features of [2].

#### 4.4.2.1 BIP/IPLI/MFS/BV-07-C [Use the Capability Object to Pull Images Lists – Client Side]

- **Test Purpose**
  - Verify that the IUT can retrieve the imaging-capabilities object, use it to learn which filtering parameters supported by the Lower Tester, and properly apply the filtering parameters to a request for an images-listing object.

- **Reference**
  - [2] 4.4.6.3, 4.5.1, 4.5.6

- **Initial Condition**
  - There shall be an active OBEX Imaging service session (Image Pull service, Archived Objects service or Remote Display service) where the IUT is the OBEX client and the Lower Tester is the OBEX server.
• Test Procedure

The above sequence is repeated four times with four different imaging-capabilities objects being returned by the Lower Tester.

Imaging-capabilities object 1: Indicates support for “creation” as the sole filtering parameter.

Imaging-capabilities object 2: Indicates support for “modified” as the sole filtering parameter.

Imaging-capabilities object 3: Indicates support for “pixel-size” as the sole filtering parameter.

Imaging-capabilities object 4: Indicates support for “encoding” as the sole filtering parameter.

For each iteration of the sequence, the GetImagesList request shall contain an image handles descriptor that uses only the filtering parameter that has been indicated as supported by the Lower Tester. If the IUT never uses the corresponding filtering parameter (see the ICS [5], for the Image Pull service, for the Archived Objects service, and for the Remote Display service), the GetImagesList request can contain an empty Img-Description header or can carry an image handles descriptor with no image-handle-filtering-parameters element or attributes.

• Expected Outcome

Pass verdict:

For each iteration of the GetImagesList request, the image handles descriptor contains only the filtering parameter that has been indicated as supported by the Lower Tester.

• Notes

The GetCapabilities function is tested in Get Imaging Capabilities – Client Side.
The GetImagesList function is tested in **BIP/IPL/FFC/BV-03-C [Get Images List – Client Side]**.

If a filtering parameter is never used by the IUT in normal operation, it is allowable to send a GetImagesList request with an empty image handles descriptor or an empty Img-Description header. It shall be mentioned in the ICS that this filtering parameter is never used.

**4.4.2.2 BIP/IPL/MFS/BV-08-C [Use the Image Property Object – Client Side]**

- **Test Purpose**
  
  Verify that the IUT can correctly read the images-listing object, use the image-properties object to individually check the images for versions other than the native format and the imaging thumbnail format, and request an image in a format other than the native one or the mandatory imaging thumbnail.

- **Reference**
  
  [2] 4.4.6.1, 4.4.6.2, 4.5.6, 4.5.7, 4.5.8

- **Initial Condition**

  There shall be an active OBEX Imaging service session (Image Pull service or Archived Objects service) where the IUT is the OBEX client and the Lower Tester is the OBEX server.

- **Test Procedure**
In the above sequence chart, N is the maximum number of handles in an images-listing object supported by the IUT (as indicated in the IXIT [9], for the Image Pull service and the Archived Objects service). n is an integer value that shall be greater than N/4.

The IUT issues a GetImagesList request with an empty image handles descriptor or an empty Img-Description header.

Upon receiving the images-listing object from the Lower Tester, the IUT shall retrieve at least one quarter of the images that are available on the Lower Tester and ask for the imaging thumbnail variant. This is done by using a GetImage request with an image descriptor matching the imaging thumbnail format.

• Expected Outcome
  
  **Pass verdict:**
  
  The GetImageProperties and GetImage requests are well formatted. The Lower Tester will specifically verify that the GetImageProperties request includes a valid ConnectionID, a Type header of “x-bt/img-properties”, and a valid image handle. The GetImage request shall contain a valid ConnectionID, a valid image handle, and a well formatted image descriptor.

  The image handle used in the GetImage request is that of an image that has a non-thumbnail variant (the associated image descriptor describes the format of this non-thumbnail variant).

• Notes
  
  The GetImagesList function is tested in BIP/IPLI/FFC/BV-03-C [Get Images List – Client Side].

  The Lower Tester will make sure that the variant is offered in a format that is supported by the IUT as declared in the IXIT [9], for the Image Pull service and the Archived Objects service. For IUTs that support only the mandatory imaging thumbnail format, this test does not apply.

4.4.2.3 **BIP/IPLI/MFS/BV-09-C [Pull an Image as Thumbnail – Client Side]**

• **Test Purpose**

  Verify that the IUT can correctly use the images-listing object to retrieve the thumbnail format of the available images (i.e. test the linkage between the GetImagesList function and the GetImage function with imaging thumbnail as the image descriptor).

• **Reference**

  [2] 4.4.6.1, 4.5.6, 4.5.8

• **Initial Condition**

  There shall be an active OBEX Imaging service session (Image Pull service or Archived Objects service) where the IUT is the OBEX client and the Lower Tester is the OBEX server.
• Test Procedure

In the above sequence chart, N is the maximum number of handles in an images-listing object supported by the IUT (as indicated in the IXIT [9], for the Image Pull service and the Archived Objects service). n is an integer value that shall be greater than N/4.

The IUT issues a GetImagesList request with an empty image handles descriptor or an empty Img-Description header.

Upon receiving the images-listing object from the Lower Tester, the IUT shall retrieve at least one quarter of the images that are available on the Lower Tester and ask for the imaging thumbnail variant. This is done by using a GetImage request with an image descriptor matching the imaging thumbnail format.

• Expected Outcome

Pass verdict:

The GetImage function is well formatted. The Lower Tester will specifically verify that the GetImage request contains valid ConnectionID, image handle, and image descriptor.

The image handle shall be chosen among the image handles returned by the Lower Tester in the images-listing object. The image descriptor shall describe an imaging thumbnail.

• Notes

The GetImagesList function is tested in BIP/IPLI/FFC/BV-03-C [Get Images List – Client Side].
4.4.2.4 BIP/IPLI/MFS/BV-10-C [Pull a Thumbnail – Client Side]

- **Test Purpose**
  Verify that the IUT can correctly use the images-listing object to retrieve thumbnails (i.e. verify the linkage between the GetImagesList function and the GetLinkedThumbnail function).

- **Reference**
  
  [2] 4.4.6.1, 4.4.7.2, 4.5.6, 4.5.8

- **Initial Condition**
  There shall be an active OBEX session (Image Pull or Archived Objects service) where the IUT is the OBEX client and the Lower Tester is the OBEX server.

- **Test Procedure**

  ![Sequence Chart](chart.png)

  In the sequence chart, N is the maximum number of handles in an images-listing object supported by the IUT, as indicated in the IXIT [9] for the Image Pull service and the Archived Objects service. n is an integer value and shall be greater than N/4.

  The IUT issues a GetImagesList request with an empty image handles descriptor or an empty Img-Description header.

  Upon receiving the images-listing object from the Lower Tester, the IUT shall retrieve at least one quarter of the images that are available on the Lower Tester and ask for the imaging thumbnail variant. This is done by using the GetLinkedThumbnail function.

- **Expected Outcome**
  
  **Pass verdict:**
The GetLinkedThumbnail requests shall be well formatted. The Lower Tester will specifically verify that the GetLinkedThumbnail request includes a valid ConnectionID, a Type header of “x-bt/img-thm”, and a valid image handle.

The image handle that is chosen in the GetLinkedThumbnail request is one of the handles advertised by the Lower Tester in the images-listing object.

- Notes
  Verifying that the GetImage response was well received is out of scope for this test.

4.4.2.5  BIP/IPLI/MFS/BV-11-C [Pull a Native Image – Client Side]

- Test Purpose
  Verify that the IUT can correctly use the images-listing object to retrieve the available images in native format.

- Reference
  [2] 4.4.6.1, 4.4.6.2, 4.4.7.2, 4.5.6, 4.5.8

- Initial Condition
  There shall be an active OBEX Imaging service session where the IUT is the OBEX client and the Lower Tester is the OBEX server.

- Test Procedure

![Diagram of the test procedure](image-url)
In the above sequence chart, N is the maximum number of handles in an images-listing object supported by the IUT, as specified in the IXIT [9], for the Image Pull service and the Archived Objects service. n is an integer that shall be superior to N/4.

The IUT issues a GetImagesList request with an empty image handles descriptor or an empty Img-Description header.

Upon receiving the images-listing object from the Lower Tester, the IUT shall retrieve at least one quarter of the images that are available on the Lower Tester and ask for the native format. This is done by using the GetImage request with an empty Img-Description header.

- **Expected Outcome**
  
  **Pass verdict:**
  
  The GetImagesList and GetImage requests are well formatted.

  The GetImage request shall contain an empty Img-Description header.

  The GetImage function is well formatted. The Lower Tester will specifically verify that the GetImage request contains valid ConnectionID, image handle, and an empty Img-Description header.

  The image handle shall be chosen among the image handles returned by the Lower Tester in the images-listing object.

- **Notes**
  
  The GetImagesList function is tested in BIP/IPL/IFFC/BV-03-C [Get Images List – Client Side].

4.4.2.6 **BIP/IPLR/MFS/BV-12-C [Pull Images – Server Side]**

- **Test Purpose**

  Verify that the IUT can correctly act as an Image Pull initiator or Automatic Archive responder (i.e. confirm the correctness of the implementations of all the mandatory functions applicable to an Image Pull initiator or an Automatic Archive responder).

- **Reference**

  [2] 4.4.2, 4.4.6.1, 4.4.6.2, 4.4.6.3, 4.5.1, 4.5.6, 4.5.7, 4.5.8, 4.5.9

- **Initial Condition**

  There shall be an active OBEX session (Image Pull or Archived Objects service) where the Lower Tester is the OBEX client and the IUT is the OBEX server.
Test Procedure

**GetCapabilities**

- GetImagesList
- GetImage(Thumbnail)
- GetImage(Native image)

**GetLinkedThumbnail**

- GetImageProperties
- GetImage(Variant)

**Lower Tester**

- Imaging Client

**IUT**

- Imaging Server

Connection establishment (primary or primary + secondary)

GET Request: GetCapabilities()

GET Response: Success (Imaging capabilities object)

GET Request: GetImagesList(Image handles descriptor)

GET Response: Success (Images listing object)

GET Request: GetImage(image handle, image descriptor=Thumbnail)

GET Response: Success (Thumbnail image)

GET Request: GetImage(image handle, Empty image descriptor)

GET Response: Success (Native image)

GET Request: GetLinkedThumbnail(image handle)

GET Response: Success (Thumbnail image)

GET Request: GetImageProperties(image handle)

GET Response: Success (Imaging properties object)

GET Request: GetImage(image handle, image descriptor=variant)

GET Response: Success (Image)

N times
(N< number of supported handles filtering parameter)
1. The Lower Tester first requests the imaging-capabilities object of the IUT.

2. Upon receiving the imaging-capabilities object and reviewing the filtering parameters that are supported by the IUT, the Lower Tester requests the list of images using “encoding” as the filtering parameters that are declared as supported by the IUT.

3. From the images-listing object it receives, the Lower Tester will pick one image at random and successively request its thumbnail (using a GetImage request with the image descriptor of an Imaging thumbnail), its native version (using a GetImage request with no imaging descriptor), and its thumbnail again (using the GetLinkedThumbnail function).

4. The Lower Tester then retrieves the image-properties object corresponding to the image it picked in step 2.

5. If the image has one or more non-thumbnail variants, the Lower Tester will request one of those variants chosen at random. If no non-thumbnail variant is available, the Lower Tester will request either the native version or its associated imaging thumbnail using a GetImage request with the corresponding image descriptor.

6. The test is then repeated three times from step 2, the Lower Tester successively using “modified”, “pixel” and “encoding” as the filtering parameter.

• Expected Outcome

Pass verdict:

The GetImage, GetLinkedThumbnail, and GetImageProperties responses shall be well formatted.

When receiving a GetImagesList with a filtering parameter that is indicated as not supported in its imaging-capabilities object, the IUT shall return a GetImagesList response with a non-filtered images-listing object and an imaging handles descriptor with no filtering element.

When receiving a GetImagesList with a filtering parameter that is indicated as supported in its imaging-capabilities object, the IUT shall return a GetImagesList response with a filtered images-listing object and an image handles descriptor identical to the one received to indicate that the filtering parameter sent by the Lower Tester was indeed applied to the images-listing object.

The various GetImage responses shall include the relevant image variants (native, thumbnail, or non-thumbnail variant).

The GetLinkedThumbnail responses shall include an imaging thumbnail.

• Notes

The GetImagesList function is tested in Get Images List – Server Side.

4.4.2.7 BIP/IPLI/MFS/BV-13-C [Delete an Image – Client Side]

• Test Purpose

Verify that the IUT can delete images on the Lower Tester.

• Reference

[2] 4.4.6.1, 4.5.6, 4.5.11

• Initial Condition

There shall be an OBEX Imaging service session active where the IUT is the OBEX client and the Lower Tester is the OBEX server.
• Test Procedure

In the above sequence chart, N is the number of handles returned by the Lower Tester in the images-listing object.

The IUT retrieves the images-listing object by issuing a GetImagesList request with no filtering parameters (the Img-Description header is empty or the image handles descriptor is empty).

Upon receiving the images-listing object, the IUT shall delete one image after another in the reverse order as the one used in the images-listing object.

• Expected Outcome

Pass verdict:

The Deletelmage request is well formatted. The Lower Tester will specifically verify that the Deletelmage request includes a valid ConnectionID and image handle.

The image handle used in the Deletelmage request belongs to the list of image handles returned by the Lower Tester in the images-listing object.

The images shall be deleted in the reverse order of their appearance in the images-listing object.

• Notes

The GetImagesList function is tested in BIP/IPL/FFC/BV-03-C [Get Images List – Client Side].
4.4.2.8 BIP/IPLR/MFS/BV-14-C [Delete an Image – Server Side]

- **Test Purpose**
  Verify that it is possible to delete pictures on the IUT and validate the linkage between the images-listing object and the image deletion operation.

- **Reference**
  [2] 4.4.6.1, 4.5.6, 4.5.11

- **Initial Condition**
  There shall be an OBEX session (Image Pull or Archived Objects service) active where the Lower Tester is the OBEX client and the IUT is the OBEX server.

  The IUT shall have at least one image locally stored and available for deletion.

- **Test Procedure**

  - **Test Procedure Diagram**

    ![Test Procedure Diagram](image)

    In the above sequence chart, N is the number of handles returned by the IUT in the first images-listing object.

    The Lower Tester will first issue a request for the list of images without filtering parameters.
Upon receiving the images-listing object from the IUT, the Lower Tester will pick n images at random (where n<N) to delete among the ones advertised in the list and order their deletion with a series of DeleteImage requests.

The Lower Tester will then issue a second request for the images-listing object and compare the images that are left with the original images-listing object.

• Expected Outcome

**Pass verdict:**

The DeleteImage function shall be well formatted. The Lower Tester will specifically verify that the request contains a valid ConnectionID and image handle and that there is no Body or EndOfBody header.

All the images whose deletion was requested by the Lower Tester shall have disappeared from the final images-listing object.

• Notes

The GetImagesList function is tested in Get Images List – Server Side.

In some IUT implementations, it is conceivable that the deletion of one image automatically results in the deletion of a series of images. For instance, on cameras that can take several images in a raw (or burst) mode, the deletion of the first raw image of the raw implies deleting all the other images that belong to the same series. This behavior is legal and might result in a final images-listing object that contains fewer images than N-n.

### 4.4.2.9 BIP/IPLI/MFS/BV-15-C [Get an Attachment – Client Side]

• Test Purpose

Verify that the IUT can properly discover the properties of an attachment and retrieve it (i.e. check the linkage between the interpretation of the images-listing object, the GetImageProperties request, and the GetLinkedAttachment request).

• Reference

[2] 4.4.4, 4.4.6.1, 4.4.6.3, 4.5.6, 4.5.7, 4.5.10

• Initial Condition

There shall be an active OBEX Imaging session (Image Pull or Archived Objects service) where the IUT is the OBEX client and the Lower Tester is the OBEX server.
• Test Procedure

The IUT retrieves the list of images available on the Lower Tester by issuing a GetImagesList request. The IUT may or may not include a non-empty image handles descriptor in the request.

Upon receiving the list of images, the IUT chooses one image and retrieves its image-properties object via a GetImageProperties request.

The IUT may or may not request the image from the Lower Tester, as in some implementations the IUT may be unable to issue a GetLinkedAttachment request on an image that has not been retrieved.
The IUT retrieves one attachment associated with the image chosen by issuing a GetLinkedAttachment request.

- **Expected Outcome**
  
  **Pass verdict:**

  The GetImageProperties and GetLinkedAttachment requests shall be well formatted. The Lower Tester will verify that the GetImageProperties request contains a valid ConnectionID, a Type header of "x-bt/img-properties", and a valid image handle in the Img-Handle header. The GetLinkedAttachment request shall include a valid ConnectionID, a Type header of "x-bt/img-attachment", a valid image handle, and a valid file name.

  The image handle passed by the IUT in the GetImageProperties and GetLinkedAttachment requests belongs to one of the handles listed by the Lower Tester in the images-listing object.

- **Notes**

  Associated with each image listed by the Lower Tester will be a number of attachments. Based on the information provided in the IXIT [9] regarding support of attachments by the IUT, the Lower Tester will make sure that for each image, at least one of the attachments is in a format supported by the IUT.

4.4.2.10 **BIP/IPLR/MFS/BV-16-C [Provide an Attachment – Server Side]**

- **Test Purpose**

  Verify that the IUT, when connected through an Imaging service (Image Pull or Archived Objects service), can properly advertise the existence of and deliver attachment files associated with image files.

- **Reference**

  [2] 4.4.4, 4.4.6.1, 4.4.6.3, 4.5.6, 4.5.7, 4.5.10

- **Initial Condition**

  There shall be an active OBEX Image Pull or Archived Objects service session where the Lower Tester is the OBEX client and the IUT is the OBEX server.
• Test Procedure

The Lower Tester retrieves the list of images available on the Lower Tester by issuing a GetImagesList request without using any of the filtering parameters.

Upon receiving the list of images, the Lower Tester will look for an image with associated attachments by retrieving the image-properties object for each image in the images-listing object.

The Lower Tester retrieves the attachments associated with the image.

• Expected Outcome

**Pass verdict:**

The GetImageProperties and GetLinkedAttachment responses shall be well formatted. The Lower Tester will specifically check that the GetImageProperties response contains a well formatted image-properties object.
The GetLinkedAttachment requests issued by the Lower Tester shall be properly processed and result in a response with the Success response code.

The attachment delivered by the IUT in the GetLinkedAttachment shall have the same characteristics as those described in the image-properties object (the Lower Tester will open the attachment file and check that the declaration in the image-properties object was correct).

4.4.3 Remotely Order an Advanced Printing Job
Test Subgroup with the objective to verify that the IUT can correctly order or perform a print job, as specified in the Advanced Image Printing feature of [2].

4.4.3.1 BIP/AIPI/MFS/BV-17-C [Use the Imaging-Capabilities Object – Client Side]

- Test Purpose
  Verify the linkage between the GetCapabilities request in the primary connection and the GetPartialImage response in the secondary connection (i.e. that the IUT is capable of correctly interpreting the imaging-capabilities object of the Lower Tester and provides image chunks in a format the Lower Tester supports).

- Reference
  [2] 4.4.6.3, 4.4.6.4, 4.5.1, 4.5.13, 4.5.14, 5.5

- Initial Condition
  There shall be an active OBEX Advanced Image Printing session where the IUT is the OBEX client (for the primary connection) and the Lower Tester is OBEX server (also for the primary connection).

  The IUT has at least two and up to ten images to be transmitted and described in the printer control object.

  The image-formats attribute in the imaging-capabilities object are set randomly by the Lower Tester but will contain at least one image format that is known to be supported by the IUT (based on the IXIT [9]), so the IUT can always find a format that will suit the Lower Tester.

- Test Procedure
  The Lower Tester sends its imaging-capabilities object in response to the GetCapabilities request.

  The IUT issues a StartPrint request containing a printing control object.

  The Lower Tester issues a StartArchive response followed by a Connect request to the Referenced Objects service of the IUT.

  The IUT accepts the Connect request and the secondary session begins.

  The Lower Tester retrieves images according to previously received printing control object and the IUT transmits the images in a format that is known to be supported by the Lower Tester (as declared in the Lower Tester’s imaging-capabilities object). The first image is retrieved in chunks of 1Kbyte long. This function is then repeated to complete the print jobs specified in the printer control object, but the images are retrieved in one block (PartialFileStartOffset always set to 0 and PartialFileLength always set to the 0xFFFFFFFF in the Application Parameters headers of the GetPartialImage requests).
The Lower Tester issues a Disconnect request.

IUT accepts the Disconnect request.

- Expected Outcome

  Pass verdict:

  The formats of transmitted images are actually available as described in the imaging-capabilities object.

- Notes

  The GetCapabilities function is tested in Get Imaging Capabilities – Client Side.

4.4.3.2  BIP/AIPR/MFS/BV-18-C [Use the Imaging-Capabilities Object – Server Side]

- Test Purpose

  Verify that the image format and DPOF options that are described in the imaging-capabilities object are actually supported by the IUT (i.e. test the linkage between the imaging-capabilities object and the GetPartialImage function).

- Reference

  [2] 4.4.6.3, 4.4.6.4, 4.5.1, 4.5.13, 4.5.14, 5.5

- Initial Condition

  There shall be an active OBEX Advanced Image Printing session where the IUT is the OBEX server (for the primary connection) and the Lower Tester is OBEX client (for the secondary connection).
The Lower Tester issues a GetCapabilities request to the IUT.

The IUT sends its imaging-capabilities object in response to the GetCapabilities request.

The Lower Tester issues a StartPrint request containing a printing control object.

Upon receiving the StartPrint request, the IUT issues a StartPrint response followed by a Connect request to the Referenced Objects service of the Lower Tester.

The Lower Tester accepts the Connect request and the secondary session is initiated.
The IUT retrieves the images according to the previously received printer control object and the Lower Tester transmits the images in a format described as supported in the imaging-capabilities object of the IUT.

The IUT, after having correctly received all the images necessary to perform the print job, issues a disconnect request in the secondary session.

The Lower Tester accepts the Disconnect request.

IUT accepts the Disconnect request.

- **Expected Outcome**
  - **Pass verdict:**
  
  The print job described in the printing control object is output.

  The images are correctly received and printed by the IUT.

- **Notes**
  
  The GetCapabilities function is tested in Get Imaging Capabilities – Server Side.

### 4.4.4 Remotely Control a Camera

Test Subgroup with the objective to verify that the IUT can correctly perform the Remote Control feature as defined in [2].

#### 4.4.4.1 BIP/RCI/MFS/BV-19-C [Take and Retrieve an Image – Client Side]

- **Test Purpose**
  
  Verify that the IUT can instruct that an image be stored and subsequently retrieved in a valid format and using the proper handle.

- **Reference**
  
  [2] 4.4.6.2, 4.4.6.5, 4.5.7, 4.5.8, 4.5.16

- **Initial Condition**
  
  There shall be an OBEX Remote Camera service session active where the IUT is the OBEX client and the Lower Tester is the OBEX server.
• Test Procedure

The IUT issues a request for a monitoring image (the StoreFlag is set to 0x01, indicating to the Lower Tester that the full image corresponding to the monitoring image should be stored and assigned an image handle).

The Lower Tester responds with a GetMonitoringImage response that includes the monitoring image object and its associated image handle.

The IUT requests the image-properties object corresponding to the stored image.

The Lower Tester returns the image-properties object of the stored image.

The IUT retrieves the full Image using a GetImage request and an image descriptor that describes one of the formats that are indicated as available in the image-properties object of the stored image.
• Expected Outcome

Pass verdict:

The GetImageProperties and GetImage requests are well formatted. The Lower Tester will especially verify that the GetImageProperties request contains a valid ConnectionID, a Type header of "x-bt/img-properties", and a valid Image handle. The GetImage request shall contain a valid ConnectionID, a Type header of "x-bt/img-thm", and a valid image handle.

The GetMonitoringImage contains a StoreFlag set to 0x01.

The handle passed by the IUT in the GetImage request is the handle that was returned by the Lower Tester in the GetMonitoringImage response.

The image format chosen by the IUT in its GetImage request is described as available by the Lower Tester in the image’s image-properties object.

• Notes

4.4.4.2 BIP/RCI/MFS/BV-20-C [Take and Retrieve an Image as Imaging Thumbnail – Client Side]

• Test Purpose

Verify that the IUT can order an image to be stored and subsequently retrieve the imaging thumbnail version of the image using the proper handle.

• Reference

[2] 4.4.6.2, 4.4.6.5, 4.5.7, 4.5.8, 4.5.16

• Initial Condition

There shall be an OBEX Remote Camera service session active where the IUT is the OBEX client and the Lower Tester is the OBEX server.
• Test Procedure

The IUT issues a request for the monitoring image (the StoreFlag is set to 0x01, indicating to the Lower Tester that the full image corresponding to the monitoring image should be stored and assigned an image handle).

The Lower Tester responds with a GetMonitoringImage response that includes the monitoring image object and its associated image handle.

The IUT retrieves the imaging thumbnail of the image using a GetImage request with the image descriptor of an imaging thumbnail and the image handle of the stored.

• Expected Outcome

Pass verdict:

The GetImage request is well formatted. The Lower Tester will especially verify that the GetImage request contains a valid ConnectionID, a Type header of "x-bt/img-img", and a valid image handle.

The GetMonitoringImage contains a StoreFlag set to 0x01.

The handle passed by the IUT in the GetImage request is the handle that was returned by the Lower Tester in the GetMonitoringImage response.

The image descriptor used in the GetImage request is that of an imaging thumbnail.
• Notes

4.4.4.3 BIP/RCI/MFS/BV-21-C [Take an Image and Retrieve its Native Version – Client Side]

• Test Purpose

Verify that the IUT can order an image to be stored and subsequently retrieve the native image of the image using the proper handle.

• Reference

[2] 4.4.6.5, 4.5.8, 4.5.16

• Initial Condition

There shall be an OBEX Remote Camera service session active where the IUT is the OBEX client and the Lower Tester is the OBEX server.

• Test Procedure

The IUT issues a request for the monitoring image (the StoreFlag is set to 0x01, indicating to the Lower Tester that the full image corresponding to the monitoring image should be stored and assigned an image handle).
The Lower Tester responds with a GetMonitoringImage response that includes the monitoring image object and its associated image handle.

The IUT retrieves the native image of the monitoring image using a GetImage request with the image handle of the stored image and an empty Img-Description header.

- **Expected Outcome**

  **Pass verdict:**

  The GetImage request is well formatted. The Lower Tester will especially verify that the GetImage request contains a valid ConnectionID, an empty Img-Description header, and a valid image handle.

  The GetMonitoringImage contains a StoreFlag set to 0x01.

  The handle passed by the IUT in the GetImage request is the handle that was returned by the Lower Tester in the GetMonitoringImage response.

- **Notes**

**4.4.4.4 BIP/RCI/MFS/BV-22-C [Take and Retrieve an Image as Imaging Thumbnail using the GetLinkedThumbnail Function – Client Side]**

- **Test Purpose**

  Verify that the IUT can order an image to be stored and subsequently retrieve the imaging thumbnail associated with this image using the proper handle and the GetLinkedThumbnail function.

- **Reference**

  [2] 4.4.6.5, 4.5.9, 4.5.16

- **Initial Condition**

  There shall be an OBEX Remote Camera service session active where the IUT is the OBEX client and the Lower Tester is the OBEX server.
• Test Procedure

The IUT issues a request for the monitoring image (the StoreFlag is set to 0x01, indicating to the Lower Tester that the full image corresponding to the monitoring image should be stored and assigned an image handle).

The Lower Tester responds with a GetMonitoringImage response that includes the monitoring image object and its associated image handle.

The IUT then retrieves the imaging thumbnail of the stored image using a GetLinkedThumbnail request with the image handle of the stored image.

• Expected Outcome

Pass verdict:

The GetLinkedThumbnail request is well formatted. The Lower Tester will especially verify that the GetLinkedThumbnail request contains a valid ConnectionID, a Type header of "x-bt/img-thm", and a valid image handle.

The GetMonitoringImage contains a StoreFlag set to 0x01.

The handle passed by the IUT in the GetLinkedThumbnail request is the handle that was returned by the Lower Tester in the GetMonitoringImage response.
• Notes

4.4.4.5 BIP/RCR/MFS/BV-23-C [Act as Remote Camera Imaging Responder – Server Side]

• Test Purpose

Verify that the IUT can correctly act as a Remote Camera server (i.e. properly implements all the mandatory functions defined for the server side of the Remote Camera feature).

• Reference

[2] 4.3.5, 4.4.6.2, 4.4.6.5, 4.5.7, 4.5.8, 4.5.9, 4.5.16

• Initial Condition

There shall be an OBEX Remote Camera service session active where the IUT is the OBEX server and the Lower Tester is the OBEX client.
• Test Procedure

The Lower Tester first requests a monitoring image to be returned by the IUT and the corresponding image to be stored.
The Lower Tester retrieves the imaging thumbnail of the stored image using a GetImage request with the image handle that was returned by the IUT in the GetMonitoringImage response and the image descriptor for an imaging thumbnail.

The Lower Tester retrieves the native image of the stored image using a GetImage request with the image handle that was returned by the IUT in the GetMonitoringImage response and an empty Img-Description header.

The Lower Tester retrieves the imaging thumbnail of the stored image using a GetLinkedThumbnail response and the image handle that was returned by the IUT in the GetMonitoringImage response.

The Lower Tester issues a request for the image-properties object of the stored image.

After reading the image-properties object and discovering that the image has one or more non-thumbnail variants available, the Lower Tester will request one of those variants chosen at random. If no non-thumbnail variant is available, the Lower Tester will request either the native version or its associated imaging thumbnail using a GetImage request with the corresponding image descriptor.

- Expected Outcome

  Pass verdict:

  The GetImage, GetLinkedThumbnail, and GetImageProperties responses shall be well formatted.

  The various GetImage responses shall include the relevant image variants (native, thumbnail, or non-thumbnail variant).

  The GetLinkedThumbnail responses shall always include an imaging thumbnail.

- Notes

4.4.5 Remotely Pilot a Display Device

Test Subgroup with the objective to verify that the IUT can correctly perform the Remote Display feature as defined in [2].

4.4.5.1 BIP/RDI/MFS/BV-24-C [Select an Image to Display After Having Pushed It – Client Side]

- Test Purpose

  Verify that the IUT push an image to the Lower Tester and request that it be displayed.

- Reference

  [2] 4.4.7.2, 4.5.2, 4.5.5

- Initial Condition

  There shall be an OBEX Remote Display service session active where the IUT is the OBEX client and the Lower Tester is the OBEX server.
• Test Procedure

The IUT pushes an image to the Lower Tester using the PutImage function.

The Lower Tester returns a Success response code accompanied with the image handle assigned to the image.

Upon receiving the image handle, the IUT uses it to request that the Lower Tester’s displaying it by issuing a RemoteDisplay request with the SelectImage command.

• Expected Outcome

Pass verdict:

The RemoteDisplay request is well formatted. The Lower Tester will specifically verify that the RemoteDisplay request contains a valid ConnectionID, a Type header of “x-bt/img-display”, the Application Parameters header set to the SelectImage command, and a valid image handle.

The image handle passed by the IUT in the RemoteDisplay request shall be the identical to the one received from the Lower Tester in the PutImage response.

• Notes

The Remote Display function is tested in BIP/RDI/FSF/BV-09-C [Go to Next Image – Client Side] and BIP/RDI/FSF/BV-10-C [Go to Previous Image – Client Side] (Application Parameters values NextImage and PreviousImage only).
4.4.5.2 BIP/RDI/MFS/BV-25-C [Select an Image to Display from the Images-Listing Object – Client Side]

- **Test Purpose**
  Verify that the IUT can select and trigger the display of images from the images-listing object.

- **Reference**
  [2] 4.5.6, 4.5.5

- **Initial Condition**
  There shall be an active OBEX Imaging service session where the IUT is the OBEX client and the Lower Tester is the OBEX server.

- **Test Procedure**

  ![Sequence Chart](chart.png)

  In the above sequence chart, N is the maximum number of image handles in an images-listing object supported by the IUT (as declared in the IXIT [9]).

  The IUT retrieves the list of Images available for display on the Lower Tester with a GetImageList request.

  The Lower Tester returns an images-listing object that contains N handles.

  The IUT chooses an image to display by issuing a RemoteDisplay request with SelectImage as the Application Parameters header and the image handle of the image of interest.

  The Lower Tester returns a Success response code after displaying the selected image.
• Expected Outcome
Pass verdict:

The RemoteDisplay request is well formatted. The Lower Tester will specifically verify that the RemoteDisplay request includes a valid ConnectionID, a Type header of “x-bt/img-display”, a valid image handle, and SelectImage as the Application Parameters header.

The image handle that is passed by the IUT in the RemoteDisplay request belongs to the list of handles returned by the Lower Tester in the images-listing object.

• Notes
The Remote Display function is tested in BIP/RDI/FSF/BV-09-C [Go to Next Image – Client Side] and BIP/RDI/FSF/BV-10-C [Go to Previous Image – Client Side] (Application Parameters values NextImage and PreviousImage only).

4.4.5.3 BIP/RDR/MFS/BV-26-C [Act as Remote Display Feature Responder – Server Side]

• Test Purpose
Verify that the IUT correctly supports all the mandatory functions of a Remote Display server.

• Reference
[2] 4.3.6, 4.4.6.3, 4.5.1, 4.5.2, 4.5.3, 4.5.5, 4.5.6

• Initial Condition
There shall be an active OBEX Remote Display Service session where the IUT is the OBEX server and the Lower Tester is the OBEX client.
• Test Procedure

PUT Request: RemoteDisplay(Image handle, AppParam=0x02)

PUT Response: Success (Image handle)

Connection establishment (Remote Display service)

n times
1. In the above sequence chart, \( n \) is at least equal to three and will be chosen at random by the Lower Tester.

2. The Lower Tester retrieves the imaging-capabilities object of the IUT and checks the formats that the IUT supports.

3. The Lower Tester pushes a series of images to the IUT. At least three images are pushed. The format in which each image is sent is chosen at random by the Lower Tester, selecting from the formats that the IUT has declared as supported in its imaging-capabilities object.

4. In response to each PutImage request, the IUT may or may not request the associated imaging thumbnail from the Lower Tester.

5. The Lower Tester retrieves the list of images available for display on the IUT. Note that the list of images shall be equal or larger to three.

6. The Lower Tester chooses one image to display by issuing a RemoteDisplay request with the Application Parameters header set to SelectImage.

7. The IUT displays the corresponding image and returns a Success code.

8. The Lower Tester orders the next image to be displayed by issuing a RemoteDisplay request with NextImage as the Application Parameters header.

9. The IUT displays the next image (as recommended in the profile, it is most desirable that the next-previous order corresponds to the order of the image handles in the images-listing object that was returned by the IUT in step 2).

10. The Lower Tester orders the previous image to be displayed by issuing a RemoteDisplay request with PreviousImage as the Application Parameters header.

• Expected Outcome

  Pass verdict:

  The RemoteDisplay responses are well formatted. The Lower Tester will specifically verify that the RemoteDisplay responses contain a valid image handle.

  The image handles returned by the IUT in the RemoteDisplay responses shall be the correct ones (i.e. the ones corresponding to the image that is being displayed).

  The IUT shall accept the images that are being pushed by the Lower Tester regardless of their format (given that the Lower Tester will only send formats that have been advertised as supported by the IUT in its imaging-capabilities object).

  After having performed “display next” and “display previous” operations, the IUT shall again be displaying the first image that it first displayed.

• Notes

  The Remote Display function is tested in BIP/RDR/FSF/BV-11-C [Go to Next Image – Server Side] and BIP/RDR/FSF/BV-12-C [Go to Previous Image – Server Side] (Application Parameters values NextImage and PreviousImage only).

4.5 Interoperability Testing

Test Group with the objective to verify the interoperability of the supported features based on the example sequences as described in Section 3.3 of the Basic Imaging Profile [2].
4.5.1 Select an Imaging Responder

Test Subgroup with the objective that the application in the Imaging Initiator will locate the Imaging Responder to start the OBEX connection. The Imaging Responder shall be in communication range (Bluetooth coverage range). If the Imaging Initiator fails to find the Imaging Responder, it cannot pass the rest of the tests.

4.5.1.1 List

- Test Purpose

  Imaging Initiator:

  To verify the accuracy of the list of devices surrounding the Imaging Initiator that potentially support the Basic Imaging Profile.

  Imaging Responder:

  To verify that the Bluetooth Responder enters the Bluetooth Imaging Mode and is discoverable and connectable.

- Test Case ID(s)

  BIP/PSI/SIR/BV-01-I
  BIP/PSR/SIR/BV-01-I
  BIP/PLI/SIR/BV-01-I

  BIP/RDR/SIR/BV-01-I

- Reference

  [2] 3.3

- Initial Condition

  Imaging Initiator:

  Standby mode.
Imaging Responder:
Standby mode.

• Test Procedure
Imaging Responder:
Select the Bluetooth Imaging Mode.

Imaging Initiator:
After setting the Imaging Responder to the Bluetooth Imaging Mode, select one of the imaging features on the Imaging Initiator.

If possible, configure the Imaging Initiator to look for the surrounding devices that support the Bluetooth Basic Imaging Profile; otherwise look for all services (the steps to trigger this inquiry may vary depending on the application).

• Expected Outcome
Pass verdict:
Imaging Initiator:
The list of surrounding devices (Imaging Responders) that support the Bluetooth Basic Imaging Profile or all Bluetooth services is correct.

Imaging Responder:
A notification that the Bluetooth Imaging mode has been entered may be given to the user of the Imaging Responder.

4.5.1.2 Imaging Responder Selection
• Test Purpose
Imaging Initiator:
To verify that the Imaging Responder selected from the list of available Imaging Responders is correct.

Imaging Responder:
To verify that one particular Imaging Responder can be selected from a group of available Imaging Responders.

• Test Case ID(s)
BIP/IPSI/SIR/BV-02-I
BIP/IPSR/SIR/BV-02-I
BIP/IPLI/SIR/BV-02-I
**Test Procedure**

**Imaging Initiator:**

Select the Imaging Responder.

**Imaging Responder:**

Perform Bluetooth PIN exchange if used.

Perform OBEX authentication if used.

(Depending on the architecture of the application using the Bluetooth imaging feature, the steps regarding how and when a Bluetooth PIN is requested may vary.)

**Expected Outcome**

**Pass verdict:**

**Imaging Initiator:**

The proper OBEX Connect response message is received from the selected Imaging Responder.
Imaging Responder:

The selected Imaging Responder sends the proper OBEX Connect response.

### 4.5.1.3 Security Check

- **Test Purpose**
  
  **Imaging Initiator:**

  To verify that, if required, security is handled correctly.

  **Imaging Responder:**

  To verify that, if required, security is handled correctly.

- **Test Case ID(s)**

  - BIP/ISI/SIR/BV-03-I
  - BIP/ISR/SIR/BV-03-I
  - BIP/IPLI/SIR/BV-03-I
  - BIP/IPLR/SIR/BV-03-I
  - BIP/AIPI/SIR/BV-03-I
  - BIP/AIPR/SIR/BV-03-I
  - BIP/AAI/SIR/BV-03-I
  - BIP/AAR/SIR/BV-03-I
  - BIP/RCI/SIR/BV-03-I
  - BIP/RCR/SIR/BV-03-I
  - BIP/RDI/SIR/BV-03-I
  - BIP/DRD/SIR/BV-03-I

- **Reference**

  [2] 3.3

- **Initial Condition**

  No bonding has been performed between the Imaging Initiator and the Imaging Responder.

  **Imaging Initiator:**

  The Bluetooth imaging application is activated.

  An Imaging Responder is selected.
Imaging Responder:

The Bluetooth Imaging mode is entered.

- **Test Procedure**

  Imaging Initiator:

  Select the Imaging Responder and initiate an OBEX Connect request.

  If a Bluetooth PIN code is requested, enter the same PIN code as on the Imaging Responder.

  If Secure Simple Pairing is supported by both sides, complete the pairing process successfully by using the user interfaces of the IUT and the other device.

  Imaging Responder:

  If a Bluetooth PIN code is requested, enter the same PIN code as on the Imaging Initiator.

  If Secure Simple Pairing is supported by both sides, complete the pairing process successfully by using the user interfaces of the IUT and the other device.

  (Depending on the architecture of the application using the Bluetooth Imaging feature, the steps regarding how and when a Bluetooth PIN is requested may vary.)

- **Expected Outcome**

  Pass verdict:

  Imaging Initiator:

  The BIP connection is successful. Security is successful.

  If a Bluetooth PIN code is requested before a Bluetooth Imaging feature is allowed to run, the entered PIN code is treated correctly and the application steps to the next state (i.e. starts the Bluetooth Imaging feature).

  Imaging Responder:

  If a Bluetooth PIN code is requested from the user before the Responder can start interacting with the Initiator, the entered PIN code is treated correctly and the application steps to the next state.

### 4.5.2 Push Images

#### 4.5.2.1 Push Images

- **Test Purpose**

  Imaging Initiator:

  Verify that the Imaging Initiator has the ability to push images to the Responder in a format supported by the Responder, after receiving the Responder’s imaging-capabilities object following a GetCapabilities request, together with their attachments (if needed) and their thumbnail (if requested by the Responder).
Imaging Responder:

Verify that the Imaging Responder can correctly respond to a GetCapabilities request from the Imaging Initiator and properly receive the images and possibly attachments sent by the Initiator after receiving a PutImage request.

• Test Case ID(s)
  BIP/IPSI/PSH/BV-01-I
  BIP/IPSR/PSH/BV-01-I

• Reference
  [2] 4.3.1

• Initial Condition

Imaging Initiator:

The Imaging Initiator has started the Image Push feature, is connected to the Imaging Responder, and has successfully performed all authentication procedures, if any.

Imaging Responder:

The Imaging Responder has entered the Bluetooth Imaging Mode, is connected to an Imaging Initiator, and has successfully performed all authentication procedures, if any.

• Test Procedure

Imaging Initiator:

The Initiator sends a GetCapabilities request to the Imaging Responder to retrieve information about the capabilities of the Imaging Responder.

An image to push is selected on the Initiator and is pushed to the Responder, possibly together with associated attachments.

Imaging Responder:

The Imaging Responder accepts the images and possibly the attachments sent by the Initiator, and it may inform the user of the Imaging Responder about the new imaging files.

• Expected Outcome

Pass verdict:

Imaging Initiator:

No error is reported. The user may be informed of the success of the push operations.

If the Imaging Responder requests a PutLinkedThumbnail, the Initiator is able to respond and provide the correct matching thumbnail.
Imaging Responder:

The Responder correctly accepts the images and is able to use them (indicating that the format under which the images were sent was indeed chosen by the Initiator in accordance with the capabilities of the Responder).

4.5.2.2 Push Images – GetCapabilities not supported by Initiator

• Test Purpose

  Imaging Initiator:

  Verify that the Imaging Initiator has the ability to push images to the Responder, when GetCapabilities is not supported, and their thumbnail (if requested by the Responder).

  Imaging Responder:

  Verify that the Imaging Responder can correctly respond to a PutImage request from the Imaging Initiator when GetCapabilities is not supported.

• Test Case ID(s)

  BIP/IPS/PSH/BV-02-I
  BIP/IPS/R/PSH/BV-02-I

• Reference

  [2] 4.3.1

• Initial Condition

  Imaging Initiator:

  The Imaging Initiator has started the Image Push feature, is connected to the Imaging Responder, and has successfully performed all authentication procedures, if any.

  Imaging Responder:

  The Imaging Responder has entered the Bluetooth Imaging Mode, is connected to an Imaging Initiator, and has successfully performed all authentication procedures, if any.

• Test Procedure

  Imaging Initiator:

  An image to push is selected on the Initiator and is pushed to the Responder.

  Imaging Responder:

  The Imaging Responder accepts the images if the images are in a supported format, and it may inform the user of the Imaging Responder about the new imaging files.
• **Expected Outcome**

*Pass verdict:*

**Imaging Initiator:**

No error is reported. The user may be informed of the success of the push operations.

If the Imaging Responder requests a PutLinkedThumbnail, the Initiator is able to respond and provide the correct matching thumbnail.

**Imaging Responder:**

The Responder correctly accepts the images if the images are in a supported format and is able to use them.

4.5.2.3 **BIP/IPSR/PSH/BI-01-I [Push Images – Unsupported PutImage Request by Initiator]**

• **Test Purpose**

**Imaging Initiator:**

Verify that the IUT (Imaging Responder) can appropriately respond to a PutImage request from the Lower Tester (Imaging Initiator) when GetCapabilities is not supported and an unsupported image format is chosen. The unsupported format can be derived from the BIP IXIT [9].

**Imaging Responder:**

Verify that the Imaging Responder can correctly respond to a PutImage request from the Imaging Initiator when GetCapabilities is not supported.

• **Reference**

[2] 4.3.1, 5.3

• **Initial Condition**

The IUT has entered the Bluetooth Imaging Mode, is connected to the Lower Tester, and has successfully performed all authentication procedures, if any.

Image format not listed in the IXIT as supported [9] is selected by the Lower Tester.

• **Test Procedure**

An image to push is selected on the Lower Tester with a format that is not supported by the IUT and is pushed to the IUT. The IUT responds with an OBEX error.

• **Expected Outcome**

*Pass verdict:*

The IUT responds appropriately with an OBEX error.
• Notes
In the case that all possible formats are supported by the IUT this test case shall be waived.

4.5.3 Pull Images

4.5.3.1 Pull Images

• Test Purpose

Imaging Initiator:

Verify the Imaging Initiator has the ability to browse through the images available on the Responder and retrieve them in the format of its choice, together with their imaging thumbnail (if needed) and their attachments (if desired).

Imaging Responder:

Verify that the Imaging Responder can correctly advertise its locally stored images and deliver them to the Initiator upon request, possibly followed by their thumbnail versions and associated attachments.

• Test Case ID(s)

BIP/IPLI/PLL/BV-01-I

BIP/IPLR/PLL/BV-01-I

• Reference

[2] 4.3.2

• Initial Condition

Imaging Initiator:

The Imaging Initiator has started the Image Pull feature, is connected to the Imaging Responder, and has successfully performed all authentication related procedures, if any.

Imaging Responder:

The Imaging Responder has entered the Bluetooth Imaging Mode, is connected to an Imaging Initiator, and has successfully performed all authentication procedures, if any.

The Imaging Responder has at least one image stored locally.

• Test Procedure

Imaging Initiator:

1. Select the image to retrieve from the list of images available on the Imaging Responder.
2. The user may be given the opportunity to filter the list of images available on the Imaging Responder, by encoding, pixel-size, creation or modification dates. If so, filtering shall be used.
3. Retrieve the selected image, together with its associated attachments (if any) and in a format supported by the Imaging Initiator.
4. Repeat step 3 as many times as necessary to confirm that all the images in the list can be transferred correctly.

**Imaging Responder**:

5. The user of the Imaging Responder might be prompted for approval of the Image Pull requests coming for the Imaging Initiator. If so, the user shall approve the transfer of the imaging data.

  - **Expected Outcome**

  **Pass verdict**:

  **Imaging Initiator**:

  - The Imaging Initiator correctly selects available filtering parameters from the Responder’s imaging-capabilities object.
  - The attributes of each image enumerated in the images-listing object match the filtering parameters supplied by the Initiator.
  - All the images in the images-listing object can be retrieved in all their native and variant forms.
  - The Imaging Initiator selects and specifies the variant from the image-properties object.
  - Attachments to the image are correctly transferred.
  - The properties of each retrieved image (pixel size, encoding, etc.) conform to the image descriptor supplied with the GetImage request.

  **Imaging Responder**:

  - No error is reported. The user may be informed of the completion of the pull operations.
  - The list of images displayed at Imaging Initiator has been filtered correctly in the Imaging Responder.
  - All the variant forms enumerated in the image-properties object are available from the Imaging Responder.
  - All the enumerated filtering parameters in the imaging-capabilities object shall be effective in the Imaging Responder.

**4.5.4**  Remotely Order Advanced Print Jobs

**4.5.4.1**  Advanced Printing – Normal

  - **Test Purpose**

    **Imaging Initiator**:

    Verify that the Imaging Initiator has the ability to correctly specify print jobs.

    **Imaging Responder**:

    Verify that the Imaging Responder can accurately print the images in accordance with the print jobs specified by the Imaging Initiator.
• Test Case ID(s)
  
  **BIP/AIPI/ADP/BV-01-I**  
  **BIP/AIPR/ADP/BV-01-I**

• Reference
  
  [2] 4.3.3, 4.4.5.1

• Initial Condition
  
  **Imaging Initiator:**
  
  The Imaging Initiator has started the Advanced Image Printing feature, is connected to the Imaging Responder, and has successfully performed all authentication procedures, if any.

  **Imaging Responder:**
  
  The Imaging Responder has entered the Bluetooth Imaging Mode, is connected to an Imaging Initiator, and has successfully performed all authentication procedures, if any.

• Test Procedure
  
  **Imaging Initiator:**
  
  The user may be informed of the capabilities of the Imaging Responder.

  The user of the Imaging Initiator selects one or a number of images to be printed, so that the full set of Advanced Image Printing capabilities supported by the Imaging Responder can be utilized.

  The user initiates the print job in accordance with the user’s choice of images and printing options.

  **Imaging Responder:**
  
  The Imaging Responder prints images that are stored locally on the Imaging Initiator device.

• Expected Outcome
  
  **Pass verdict:**
  
  **Imaging Initiator:**
  
  • The user may be informed of the success of the print jobs.

  **Imaging Responder:**
  
  • The responder successfully prints one or more images.
  
  • The images that are printed are the images that had been selected on the Imaging Initiator.
  
  • The printing output corresponds to the options and settings that were specified by the Imaging Initiator.
4.5.5  Automatically Archive Images

4.5.5.1  Automatically Archive Images

• Test Purpose

  Imaging Initiator:

  Verify that the Imaging Initiator can command the Imaging Responder to archive its locally stored images and properly deliver those images to the Responder. The process shall start either automatically when the Initiator comes within Bluetooth range of the responder, or after a user interaction on the Initiator.

  Imaging Responder:

  Verify that the Imaging Responder has the ability to perform the image archiving operation commanded by the Initiator.

• Test Case ID(s)

  BIP/AAI/ACH/BV-01-I
  BIP/AAR/ACH/BV-01-I

• Reference

  [2] 4.3.4

• Initial Condition

  Imaging Initiator:

  The Imaging Initiator has entered the Automatic Archive feature, is connected to the Imaging Responder, and has successfully performed all authentication related, if any.

  Imaging Responder:

  The Imaging Responder has entered the Bluetooth Imaging Mode, is connected to an Imaging Initiator, and has successfully performed all authentication related, if any.

  The Imaging Initiator shall have at least one image stored locally.

• Test Procedure

  Imaging Initiator:

  (Depending on the implementation, it might be enough to enter the Bluetooth Automatic Archive feature to trigger the archiving operation.)

  The user of the Imaging Initiator triggers the archiving operation.

  Imaging Responder:

  The Imaging Responder downloads the imaging files from the Imaging Initiator according to its algorithm.
• Expected Outcome

Pass verdict:

Imaging Initiator:

No error is reported.

Imaging Responder:

The Imaging Responder was able to download the images the Imaging Initiator according to its algorithm and settings (for instance, whether the Responder is to download all the images stored on the Initiator or only selected ones).

4.5.6 Remotely Capture Images

4.5.6.1 Receive Monitoring Images and Have Full Size Images Stored

• Test Purpose

Imaging Initiator:

Verify that the Imaging Initiator has the ability to correctly receive monitoring images and remotely trigger the capture of full size images to be stored on the Imaging Responder.

Imaging Responder:

Verify that the Imaging Responder can accurately deliver monitoring images to the Initiator while storing the corresponding full size images when requested by the Initiator.

• Test Case ID(s)

BIP/RCI/RMC/BV-02-I

BIP/RCR/RMC/BV-02-I

• Reference

[2] 4.3.5, 4.4.5.5

• Initial Condition

Imaging Initiator:

The Imaging Initiator has started the Remote Camera feature, is connected to the Imaging Responder, and has successfully performed all authentication procedures, if any.

Imaging Responder:

The Imaging Responder has entered the Bluetooth Imaging Mode, is connected to an Imaging Initiator, and has successfully performed all authentication related procedures, if any.
• Test Procedure

Imaging Initiator:

The Imaging Initiator requests monitoring images from the Imaging Responder and receives them. Depending on the implementation of the Remote Camera feature, the Imaging Initiator might also have the ability to trigger the Imaging Responder to actually capture and save an image. The Imaging Initiator may or may not retrieve the stored image.

Imaging Responder:

The Imaging Responder produces monitoring images and sends them back to the Imaging Initiator. If requested to do by the Imaging Initiator, the Imaging Responder will capture and store an image. If requested by the Initiator, the Responder sends the locally stored images back to the Initiator.

• Expected Outcome

Pass verdict:

Imaging Initiator:

The Imaging Initiator was able to trigger the Imaging Responder to capture an image and the monitoring images received from the Imaging Responder correspond to the expectations of the Imaging Initiator.

If the Imaging Initiator retrieved other imaging data from the Responder (i.e. images in a format different from the monitoring image format), those images shall be useable by the Initiator (i.e. in a format that is supported by the Initiator).

Imaging Responder:

The Imaging Responder was able to transmit monitoring images to the Initiator. Upon request by the Initiator, the Responder was capture images, store the corresponding image files, and, if necessary, transmit the image file to the Initiator in an appropriate format.

4.5.7 Remotely Control a Display

4.5.7.1 Control the Display of a Remote Device

• Test Purpose

Imaging Initiator:

Verify the Imaging Initiator has the ability to send images to the Responder and control their display sequence.

Imaging Responder:

Verify that the Imaging Responder has the ability to receive images from the Initiator and display them following the instructions of the Initiator.
• Test Case ID(s)

BIP/RDI/RMD/BV-01-I
BIP/RDR/RMD/BV-01-I

• Reference

[2] 4.3.6

• Initial Condition

Imaging Initiator:

The Imaging Initiator has entered the Remote Display feature, is connected to the Imaging Responder, and has successfully performed all authentication procedures, if any.

Imaging Responder:

The Imaging Responder has entered the Bluetooth Imaging Mode, is connected to an Imaging Initiator, and has successfully performed all authentication procedures, if any. The Imaging Responder is not displaying an image.

• Test Procedure

Imaging Initiator:

The Imaging Initiator may start by sending a number of images to the Imaging Responder.

The Imaging Initiator may inform the user of the images that are available for display on the Imaging Responder via a list of images displayed to the user.

The user or an automatic process selects the images to be displayed or simply orders the Responder to proceed to the next or previous image (next and previous refer to the display order as determined by the Imaging Responder).

Imaging Responder:

The Imaging Responder displays images in accordance to the instructions from the Imaging Initiator.

• Expected Outcome

Pass verdict:

Imaging Initiator:

No error is reported.

Imaging Responder:

The Responder displays the image following the Initiator’s instructions.
## 5 Test Case Mapping

The Test Case Mapping Table (TCMT) maps test cases to specific requirements in the ICS. The product shall be tested in all roles for which support is declared in the ICS document.

The columns for the TCMT are defined as follows:

**Item**: Contains a y/x reference, where y corresponds to the table number and x corresponds to the feature number as defined in the ICS Proforma for Basic Imaging Profile (BIP) [5]. If the item is defined with Protocol, Profile or Service abbreviation before y/x, the table and feature number referenced are defined in the abbreviated ICS Proforma document.

**Feature**: Recommended to be the primary feature defined in the ICS being tested or may be the test case name.

**Test Case(s)**: The applicable test case identifiers required for Bluetooth Qualification if the corresponding y/x references defined in the Item column are supported.
