Expedited Errata Correction

11838: Encryption Key Size Updates

Bluetooth® Expedited Errata Correction

- **Revision**: v1.0
- **Revision Date**: 2019-08-13
- **Group Prepared By**: Core Specification Working Group
- **Feedback Email**: core-main@bluetooth.org

This Expedited Errata Correction is mandatory and applies to the following specifications (collectively, the "Source Specifications"):

- Core Specification v5.1 [1]
- Core Specification v5.0 [2]
- Core Specification v4.2 [3]

**Abstract:**

This document specifies the changes to be applied to the Core Specifications required to incorporate the various encryption key size related updates.
Erratum 11838: Encryption Key Size Updates / Error Correction

Use of this specification is your acknowledgement that you agree to and will comply with the following notices and disclaimers. You are advised to seek appropriate legal, engineering, and other professional advice regarding the use, interpretation, and effect of this specification.

Use of Bluetooth specifications by members of Bluetooth SIG is governed by the membership and other related agreements between Bluetooth SIG and its members, including those agreements posted on Bluetooth SIG’s website located at www.bluetooth.com. Any use of this specification by a member that is not in compliance with the applicable membership and other related agreements is prohibited and, among other things, may result in (i) termination of the applicable agreements and (ii) liability for infringement of the intellectual property rights of Bluetooth SIG and its members.

Use of this specification by anyone who is not a member of Bluetooth SIG is prohibited and is an infringement of the intellectual property rights of Bluetooth SIG and its members. The furnishing of this specification does not grant any license to any intellectual property of Bluetooth SIG or its members. THIS SPECIFICATION IS PROVIDED “AS IS” AND BLUETOOTH SIG, ITS MEMBERS AND THEIR AFFILIATES MAKE NO REPRESENTATIONS OR WARRANTIES AND DISCLAIM ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING ANY WARRANTIES OF MERCHANTABILITY, TITLE, NON-INFRINGEMENT, FITNESS FOR ANY PARTICULAR PURPOSE, OR THAT THE CONTENT OF THIS SPECIFICATION IS FREE OF ERRORS. For the avoidance of doubt, Bluetooth SIG has not made any search or investigation as to third parties that may claim rights in or to any specifications or any intellectual property that may be required to implement any specifications and it disclaims any obligation or duty to do so.

TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW, BLUETOOTH SIG, ITS MEMBERS AND THEIR AFFILIATES DISCLAIM ALL LIABILITY ARISING OUT OF OR RELATING TO USE OF THIS SPECIFICATION AND ANY INFORMATION CONTAINED IN THIS SPECIFICATION, INCLUDING LOST REVENUE, PROFITS, DATA OR PROGRAMS, OR BUSINESS INTERRUPTION, OR FOR SPECIAL, INDIRECT, CONSEQUENTIAL, INCIDENTAL OR PUNITIVE DAMAGES, HOWEVER CAUSED AND REGARDLESS OF THE THEORY OF LIABILITY, AND EVEN IF BLUETOOTH SIG, ITS MEMBERS OR THEIR AFFILIATES HAVE BEEN ADVISED OF THE POSSIBILITY OF THE DAMAGES.

If this specification is a prototyping specification, it is solely for the purpose of developing and using prototypes to verify the prototyping specifications at Bluetooth SIG sponsored IOP events. Prototyping Specifications cannot be used to develop products for sale or distribution and prototypes cannot be qualified for distribution.

Products equipped with Bluetooth wireless technology (“Bluetooth Products”) and their combination, operation, use, implementation, and distribution may be subject to regulatory controls under the laws and regulations of numerous countries that regulate products that use wireless non-licensed spectrum. Examples include airline regulations, telecommunications regulations, technology transfer controls and health and safety regulations. You are solely responsible for complying with all applicable laws and regulations and for obtaining any and all required authorizations, permits, or licenses in connection with your use of this specification and development, manufacture, and distribution of Bluetooth Products. Nothing in this specification provides any information or assistance in connection with complying with applicable laws or regulations or obtaining required authorizations, permits, or licenses.

Bluetooth SIG is not required to adopt any specification or portion thereof. If this specification is not the final version adopted by Bluetooth SIG’s Board of Directors, it may not be adopted. Any specification adopted by Bluetooth SIG’s Board of Directors may be withdrawn, replaced, or modified at any time. Bluetooth SIG reserves the right to change or alter final specifications in accordance with its membership and operating agreements.

### 2 Changes to Core Specification v5.1

This Section sets forth the specific changes and additions, using the formatting and color conventions described in Section 1.2, to Core Specification v5.1.

#### 2.1 Changes to Core Specification v5.1, Volume 2, Part C: Link Manager Protocol Specification

[Modified Section] **4.2.5.2 Encryption key size**

[Modify the second paragraph as shown below and add a new paragraph and a note after what is now the fourth paragraph.]

The master sends an LMP_encryption_key_size_req PDU including the suggested key size \( L_{\text{sug}, m} \), that shall is initially be equal to \( L_{\text{max}, m} \). If \( L_{\text{min}, s} \leq L_{\text{sug}, m} \leq L_{\text{max}, s} \) and the slave supports \( L_{\text{sug}, m} \), the slave shall respond with an LMP_accepted PDU and \( L_{\text{sug}, m} \) shall be used as the key size.

[Insert paragraph break]

If \( L_{\text{sug}, m} > L_{\text{max}, s} \), the slave shall send back an LMP_encryption_key_size_req PDU including the slave’s suggested key size \( L_{\text{sug}, s} \) set to \( L_{\text{max}, s} \). If \( L_{\text{sug}, m} < L_{\text{min}, s} \), the slave shall send back an LMP_not_accepted PDU with the error code *Unsupported LMP Parameter Value* (0x20) and the devices shall not communicate using encryption. If both conditions are not fulfilled the slave sends back an LMP_encryption_key_size_req PDU including the slave’s suggested key size \( L_{\text{sug}, s} \). This value shall be the slave’s largest supported key size that is less than \( L_{\text{sug}, m} \).

[Insert paragraph break]

If the slave sends back an LMP_encryption_key_size PDU, then the master performs the corresponding test on the slave’s suggestion. This procedure is repeated until a key size agreement is reached or it becomes clear that no such agreement can be reached. If an agreement is reached a device sends an LMP_accepted PDU and the key size in the last LMP_encryption_key_size_req PDU shall be used.

[Insert paragraph break]

If a key size is agreed, encryption is then started. After this, encryption is started; see Section 4.2.5.3. If an agreement is not reached a device sends an LMP_not_accepted PDU with the error code *Unsupported LMP Parameter Value* (0x20) and the devices shall not communicate using encryption.

\( L_{\text{max}, m} \) and \( L_{\text{max}, s} \) shall be set to at least 7 octets. \( L_{\text{min}, m} \) and \( L_{\text{min}, s} \) should be set to at least 7 octets. The values of \( L_{\text{max}, m} \), \( L_{\text{min}, m} \), \( L_{\text{max}, s} \) and \( L_{\text{min}, s} \) shall not change during an ACL connection between the master and the slave.

Note: If the Host of either the master or the slave uses services that require security mode 4 (see [Vol 3] Part C, Section 5.2.2.8), a key size higher than the key size negotiated by the two Link Managers can be enforced.
2.2 Changes to Core Specification v5.1, Volume 2, Part E: Host Controller Interface Functional Specification

2.2.1 [Modified Section] 7.5.7 Read Encryption Key Size command

[Add a new paragraph at the end of the Description as shown below.]

Description:

This command reads the current encryption key size associated with the Connection_Handle. The Connection_Handle shall be a Connection_Handle for an active ACL connection.

All BR/EDR Controllers shall implement this command.

2.3 Changes to Core Specification v5.1, Volume 3, Part C: Generic Access Profile

2.3.1 [Modified Section] 5.2.2.8 Security database

[Modify the text as shown below.]

A Bluetooth device in security mode 4 shall classify and enforce the security requirements of its services using at least the following levels attributes (in order of decreasing security) for use when pairing with remote devices supporting Secure Simple Pairing:

• Level 4, for services with the following attributes:

  MITM protection required

  128-bit equivalent strength for link and encryption keys required using FIPS approved algorithms (E0 not allowed, SAFER+ not allowed, and P-192 not allowed; encryption key not shortened)

  User interaction acceptable

• Level 3, for services with the following attributes:

  MITM protection required

  Encryption required

  At least 56-bit equivalent strength for encryption key should be used

  User interaction acceptable

• Level 2, for services with the following attributes:

  MITM protection not required

  Encryption required

  At least 56-bit equivalent strength for encryption key should be used

• Level 1, for services with the following attributes:
MITM protection not required

At least 56-bit equivalent strength for encryption key when encryption is enabled should be used

Minimal user interaction desired

• Level 0: Service requires the following:
  
  MITM protection not required

  No encryption required

  No user interaction required

Security Mode 4 Level 0 shall only be used for:

  a) L2CAP fixed signaling channels with CIDs 0x0001, 0x0003, and 0x003F

  b) SDP

  c) broadcast data sent on the connectionless L2CAP channel (CID 0x0002)

  d) services with the combinations of Service Class UUIDs and L2CAP traffic types listed in [Core Specification Supplement], Part C, Section 1.

The security level required for each service offered should be stored in a security database that is accessed to determine the type of link key and the encryption key size that is required for access to the respective service. The security level required for service data transmitted on an L2CAP connection-oriented channel may differ from the security level required for service data transmitted on another L2CAP connection-oriented channel or on the connectionless L2CAP channel. Table 5.8 shows the type of link key required for each security level for both remote devices that support Secure Simple Pairing (v2.1 + EDR remote devices) and for those that do not (pre-v2.1 + EDR remote devices).

A previously generated link key is considered “sufficient” if the link key type is of the type required for the service, or of a higher strength. Authenticated link keys are considered higher strength than Unauthenticated or Combination keys. Unauthenticated link keys are considered higher strength than Combination keys.

A device shall enforce an encryption key with at least 128-bit equivalent strength for all services that require Security Mode 4, Level 4. For all other services that require encryption, a device should enforce an encryption key with at least 56-bit equivalent strength, irrespective of whether the remote device supports Secure Simple Pairing.

After encryption has been enabled, the Host should check the encryption key size using either the HCI_Read_Encryption_Key_Size command (see [Vol 2] Part E, Section 7.5.7) or a vendor-specific method.
3 Changes to Core Specification v5.0

This Section sets forth the specific changes and additions, using the formatting and color conventions described in Section 1.2, to Core Specification v5.0.

3.1 Changes to Core Specification v5.0, Volume 2, Part C: Link Manager Protocol Specification

3.1.1 [Modified Section] 4.2.5.2 Encryption key size

[Insert a paragraph break after the Note as shown below and add a new paragraph and a note after what is now the fourth paragraph.]

Note: This section uses the same terms as in [Vol 2] Part H, Section 4.1.

The master sends an LMP_encryption_key_size_req PDU including the suggested key size $L_{sug, m}$, that shall be initially set equal to $L_{max, m}$. If $L_{min, s} \leq L_{sug, m} \leq L_{max, s}$ and the slave supports $L_{sug, m}$, the slave shall respond with an LMP_accepted PDU and $L_{sug, m}$ shall be used as the key size.

[Insert paragraph break]

If $L_{sug, m} > L_{max, s}$, the slave shall send back an LMP_encryption_key_size_req PDU including the slave’s suggested key size $L_{sug, s}$ set to $L_{max, s}$. If $L_{sug, m} < L_{min, s}$, the slave shall send back an LMP_not_accepted PDU with the error code Unsupported LMP Parameter Value (0x20) and the devices shall not communicate using encryption. If both conditions are not fulfilled the slave sends back an LMP_encryption_key_size_req PDU including the slave’s suggested key size $L_{sug, s}$. This value shall be the slave’s largest supported key size that is less than $L_{sug, m}$.

[Insert paragraph break]

If the slave sends back an LMP_encryption_key_size PDU, then the master performs the corresponding test on the slave’s suggestion. This procedure is repeated until a key size agreement is reached or it becomes clear that no such agreement can be reached. If an agreement is reached a device sends an LMP_accepted PDU and the key size in the last LMP_encryption_key_size_req PDU shall be used.

[Insert paragraph break]

If a key size is agreed, encryption is then started. After this, encryption is started, see Section 4.2.5.3. If an agreement is not reached a device sends an LMP_not_accepted PDU with the error code Unsupported LMP Parameter Value (0x20) and the devices shall not communicate using encryption.

$L_{max, m}$ and $L_{max, s}$ shall be set to at least 7 octets. $L_{min, m}$ and $L_{min, s}$ should be set to at least 7 octets. The values of $L_{max, m}$, $L_{min, m}$, $L_{max, s}$ and $L_{min, s}$ shall not change during an ACL connection between the master and the slave.

Note: If the Host of either the master or the slave uses services that require security mode 4 (see [Vol 3] Part C, Section 5.2.2.8), a key size higher than the key size negotiated by the two Link Managers can be enforced.
3.2 Changes to Core Specification v5.0, Volume 2, Part E: Host Controller Interface Functional Specification

3.2.1 [Modified Section] 7.5.7 Read Encryption Key Size command

[Add a new paragraph at the end of the Description as shown below.]

Description:

This command reads the current encryption key size associated with the Connection_Handle. The Connection_Handle shall be a Connection_Handle for an active ACL connection.

All BR/EDR Controllers shall implement this command.

3.3 Changes to Core Specification v5.0, Volume 3, Part C: Generic Access Profile

3.3.1 [Modified Section] 5.2.2.8 Security database

[Modify the text as shown below.]

A Bluetooth device in security mode 4 shall classify and enforce the security requirements of its services using at least the following levels attributes (in order of decreasing security) for use when pairing with remote devices supporting Secure Simple Pairing:

• Level 4, for services with the following attributes:

  MITM protection required

  128-bit equivalent strength for link and encryption keys required using FIPS approved algorithms (E0 not allowed, SAFER+ not allowed, and P-192 not allowed; encryption key not shortened)

  User interaction acceptable

• Level 3, for services with the following attributes:

  MITM protection required

  Encryption required

  At least 56-bit equivalent strength for encryption key should be used

  User interaction acceptable

• Level 2, for services with the following attributes:

  MITM protection not required

  Encryption required

  At least 56-bit equivalent strength for encryption key should be used

• Level 1, for services with the following attributes:
MITM protection not required

At least 56-bit equivalent strength for encryption key when encryption is enabled should be used

Minimal user interaction desired

• Level 0: Service requires the following:
  MITM protection not required
  No encryption required
  No user interaction required

Security Mode 4 Level 0 shall only be used for:

  a) L2CAP fixed signaling channels with CIDs 0x0001, 0x0003, and 0x003F
  
  b) SDP
  
  c) broadcast data sent on the connectionless L2CAP channel (CID 0x0002)

  d) services with the combinations of Service Class UUIDs and L2CAP traffic types listed in [Core Specification Supplement], Part C, Section 1.

The security level required for each service offered should be stored in a security database that is accessed to determine the type of link key and the encryption key size that is required for access to the respective service. The security level required for service data transmitted on an L2CAP connection-oriented channel may differ from the security level required for service data transmitted on another L2CAP connection-oriented channel or on the connectionless L2CAP channel. Table 5.8 shows the type of link key required for each security level for both remote devices that support Secure Simple Pairing (v2.1 + EDR remote devices) and for those that do not (pre-v2.1 + EDR remote devices).

A previously generated link key is considered “sufficient” if the link key type is of the type required for the service, or of a higher strength. Authenticated link keys are considered higher strength than Unauthenticated or Combination keys. Unauthenticated link keys are considered higher strength than Combination keys.

A device shall enforce an encryption key with at least 128-bit equivalent strength for all services that require Security Mode 4, Level 4. For all other services that require encryption, a device should enforce an encryption key with at least 56-bit equivalent strength, irrespective of whether the remote device supports Secure Simple Pairing.

After encryption has been enabled, the Host should check the encryption key size using either the HCI_Read_Encryption_Key_Size command (see [Vol 2] Part E, Section 7.5.7) or a vendor-specific method.
4 Changes to Core Specification v4.2

This Section sets forth the specific changes and additions, using the formatting and color conventions described in Section 1.2, to Core Specification v4.2.

4.1 Changes to Core Specification v4.2, Volume 2, Part C: Link Manager Protocol Specification

4.1.1 [Modified Section] 4.2.5.2 Encryption key size

Note: This section uses the same terms as in [Vol 2] Part H, Section 4.1.

The master sends an LMP_encryption_key_size_req PDU including the suggested key size $L_{\text{sug}, m}$, that shall initially be equal to $L_{\text{max}, m}$. If $L_{\text{min}, s} \leq L_{\text{sug}, m} \leq L_{\text{max}, s}$ and the slave supports $L_{\text{sug}, m}$, it, the slave shall respond with an LMP_accepted PDU and $L_{\text{sug}, m}$ shall be used as the key size.

If $L_{\text{sug}, m} > L_{\text{max}, s}$, the slave shall send back an LMP_encryption_key_size_req PDU including the slave’s suggested key size $L_{\text{sug}, s}$ set to $L_{\text{max}, s}$. If $L_{\text{sug}, m} < L_{\text{min}, s}$, the slave shall send back an LMP_not_accepted PDU with the error code unsupported LMP Parameter Value (0x20) and the devices shall not communicate using encryption. If both conditions are not fulfilled the slave sends back an LMP_encryption_key_size_req PDU including the slave’s suggested key size $L_{\text{sug}, s}$. This value shall be the slave’s largest supported key size that is less than $L_{\text{sug}, m}$.

If the slave sends back an LMP_encryption_key_size PDU, then the master performs the corresponding test on the slave’s suggestion. This procedure is repeated until a key size agreement is reached or it becomes clear that no such agreement can be reached. If an agreement is reached a device sends an LMP_accepted PDU and the key size in the last LMP_encryption_key_size_req PDU shall be used.

If a key size is agreed, encryption is then started. After this, encryption is started; see Section 4.2.5.3. If an agreement is not reached a device sends an LMP_not_accepted PDU with the error code unsupported LMP Parameter Value (0x20) and the devices shall not communicate using encryption.

$L_{\text{max}, m}$ and $L_{\text{max}, s}$ shall be set at least 7 octets. $L_{\text{min}, m}$ and $L_{\text{min}, s}$ should be set to at least 7 octets. The values of $L_{\text{max}, m}$, $L_{\text{min}, m}$, $L_{\text{max}, s}$ and $L_{\text{min}, s}$ shall not change during an ACL connection between the master and the slave.

Note: It the Host of either the master or the slave uses services that require security mode 4 (see [Vol 3] Part C, Section 5.2.2.8), a key size higher than the key size negotiated by the two Link Managers can be enforced.

4.2.1 [Modified Section] 7.5.7 Read Encryption Key Size command

[Add a new paragraph at the end of the Description as shown below.]

**Description:**

This command reads the current encryption key size associated with the Connection_Handle. The Connection_Handle shall be a Connection_Handle for an active ACL connection.

All BR/EDR Controllers shall implement this command.

4.3 Changes to Core Specification v4.2, Volume 3, Part C: Generic Access Profile

4.3.1 [Modified Section] 5.2.2.8 Security database

[Modify the text as shown below.]

A Bluetooth device in security mode 4 shall classify and enforce the security requirements of its services using at least the following levels attributes (in order of decreasing security) for use when pairing with remote devices supporting Secure Simple Pairing:

- **Level 4**, for services with the following attributes or devices in Secure Connections Only Mode:
  
  MITM protection required
  
  128-bit equivalent strength for link and encryption keys required using FIPS approved algorithms (E0 not allowed, SAFER+ not allowed, and P-192 not allowed; encryption key not shortened)
  
  User interaction acceptable

- **Level 3**, for services with the following attributes:
  
  MITM protection required
  
  Encryption required
  
  At least 56-bit equivalent strength for encryption key should be used
  
  User interaction acceptable

- **Level 2**, for services with the following attributes:
  
  MITM protection not required
  
  Encryption required
  
  At least 56-bit equivalent strength for encryption key should be used

- **Level 1**, for services with the following attributes:
MITM protection not required

At least 56-bit equivalent strength for encryption key when encryption is enabled should be used

Minimal user interaction desired

• Level 0: Service requires the following:

  MITM protection not required

  No encryption required

  No user interaction required

Security Mode 4 Level 0 shall only be used for:

  a) L2CAP fixed signaling channels with CIDs 0x0001, 0x0003, and 0x003F

  b) SDP

  c) broadcast data sent on the connectionless L2CAP channel (CID 0x0002)

  d) services with the combinations of Service Class UUIDs and L2CAP traffic types listed in [Core Specification Supplement], Part C, Section 1.

The security level required for each service offered should be stored in a security database that is accessed to determine the type of link key and the encryption key size that is required for access to the respective service. The security level required for service data transmitted on an L2CAP connection-oriented channel may differ from the security level required for service data transmitted on another L2CAP connection-oriented channel or on the connectionless L2CAP channel. Table 5.8 shows the type of link key required for each security level for both remote devices that support Secure Simple Pairing (v2.1 + EDR remote devices) and for those that do not (pre-v2.1 + EDR remote devices).

A previously generated link key is considered “sufficient” if the link key type is of the type required for the service, or of a higher strength. Authenticated link keys are considered higher strength than Unauthenticated or Combination keys. Unauthenticated link keys are considered higher strength than Combination keys.

A device shall enforce an encryption key with at least 128-bit equivalent strength for all services that require Security Mode 4, Level 4. For all other services that require encryption, a device should enforce an encryption key with at least 56-bit equivalent strength, irrespective of whether the remote device supports Secure Simple Pairing.

After encryption has been enabled, the Host should check the encryption key size using either the HCI_Read_Encryption_Key_Size command (see [Vol 2] Part E, Section 7.5.7) or a vendor-specific method.
